Conflict of Interest Disclosures: The authors have no conflicts of interest to disclose.

## 1           **Considerations for Incorporating Implementation Science into Dietetics Education**

2  
3 Often, health professions faculty and preceptors, including those in dietetics, are not trained how  
4 to teach. Rather, they learn from self-study, colleagues, and their own past experiences in the  
5 classroom. While evidence-based teaching strategies exist, there is often little information  
6 available on how to implement those strategies in a classroom and how they may be adapted to a  
7 particular context.<sup>1</sup>

8  
9 As an evidence-based profession, it is imperative that dietetics educators use evidence-based  
10 teaching and training strategies, not only in the classroom but in the design and administration of  
11 the variety of dietetics program types now available. Still, information on how to implement  
12 something as small as an individual teaching strategy or as large as a particular program type is  
13 lacking in the dietetics higher education literature. Implementation science (IS) is the study of  
14 the process of implementation, implementation outcomes and their predictors, and strategies to  
15 promote effective implementation of evidence-based practices.<sup>2</sup> The field of IS is dedicated to  
16 answering the question, “How do I implement a particular evidence-based item (intervention,  
17 program, teaching strategy, etc.)?” As new program types emerge in dietetics education, like  
18 Future Education Model (FEM) Associate Degree Programs (APs), Bachelor Degree Programs  
19 (BPs), and Graduate Degree Programs (GPs),<sup>3</sup> it is imperative that program directors know how  
20 to implement these programs as intended in order to achieve the student outcomes desired.  
21 Furthermore, use of IS in education of other health professions is emerging as best practice. The  
22 National Academies of Sciences, Engineering, and Medicine Global Forum on Innovations in  
23 Health Professional Education devoted an entire workshop to exploring the use and application  
24 of IS in health professions education, in fact.<sup>4,5</sup> While dietetics representatives were invited to  
25 contribute to this workshop, examples of IS in dietetics higher education were limited. As other  
26 health professions begin to utilize IS in their education programs, translation of evidence-based  
27 strategies into their teaching and program administration will occur more rapidly. Lagging  
28 behind in this IS initiative could eventually compromise the evidence base of dietetics education.  
29 In order to achieve and maintain its position as a valued member of the interprofessional team, it  
30 is critical that dietetics follow suit in this endeavor to elevate health professions education,  
31 including dietetics. Thus, the aim of this article is to provide readers with tangible tools to  
32 document and report implementation of evidence-based strategies in their dietetics classrooms  
33 and programs.

### 34 35 **What Is Implementation Science?**

36  
37 The field of IS is relatively new, particularly within higher education and dietetics education.<sup>2</sup>  
38 However, a variety of theories, models, and frameworks<sup>6</sup> exist to guide researchers, practitioners,  
39 and instructors in considering the three primary aspects of implementation to study or simply  
40 consider in their teaching and program administration:

- 41       1) *implementation context* (where the intervention is implemented, e.g., large public  
42       university, small private college, large city with many facilities for student  
43       practicum/supervised practice placement, small city with few facilities for student  
44       experiential learning), and the barriers and facilitators (*determinants*) to implementation  
45       that the context presents;

- 46 2) *implementation outcomes* (reach, feasibility, sustainability, cost, and other characteristics  
47 of the program itself); and  
48 3) *implementation strategies* (actions taken by colleges/universities, program directors, or  
49 instructors to improve implementation outcomes).<sup>2</sup>

50 Determinant frameworks, such as the Consolidated Framework of Implementation Research  
51 (CFIR), guide the study of implementation contexts, allowing for identification of barriers to and  
52 facilitators of implementation affecting implementation outcomes.<sup>2, 7</sup> Evaluation frameworks,  
53 such as the RE-AIM (Reach, Effectiveness, Adoption, Implementation, Maintenance)  
54 framework, guide the study of implementation outcomes (feasibility and sustainability of a  
55 program model, for example) along with the more traditional student outcomes of interest, such  
56 as student acceptance rates into dietetic internships, student pass rates on the Commission on  
57 Dietetic Registration (CDR) exam, and student employment rates post-graduation.<sup>2, 8</sup>  
58 Implementation strategies encompass a wide variety of approaches targeted at different  
59 “stakeholders” within program implementation, from the student to the instructor, program  
60 director, and even college/university administration.<sup>2, 9, 10</sup>

61

### 62 **How Is Implementation Science Currently Used in Dietetics?**

63

64 *To move evidence-based nutrition guidelines into dietetics practice.* Much of the current IS work  
65 in the dietetics field is focused on nutrition and health education for the public.<sup>2</sup> For example,  
66 large IS studies have evaluated implementation of the MOVE Weight Management Program  
67 implemented in Veterans’ Affairs hospitals, as well as CDC’s National Diabetes Prevention  
68 Program lifestyle change program.<sup>11-15</sup> These studies used standardized tools/frameworks (many  
69 of which are discussed in later sections of this article) to document how they implemented their  
70 programs, barriers they encountered and supports they received during implementation, and how  
71 they overcame those barriers and capitalized on those supports.<sup>11-15</sup> Outcomes reported included  
72 how the researchers measured fidelity of implementation to the program protocol, any  
73 adaptations they had to make, degree of uptake of the program by all those eligible to implement  
74 it, and how many people were reached by the program compared to the number of eligible  
75 participants.<sup>11-15</sup>

76

77 Several articles have been published in recent years introducing ways to use IS to advance use of  
78 evidence-based nutrition guidelines in nutrition practice. In 2019, Tumilowicz et al. presented IS  
79 frameworks that may be used to address implementation questions in regard to nutrition practices  
80 and interventions, as well as several examples of how these have been used to address  
81 malnutrition across the globe.<sup>16</sup> In 2021, Murofushi et al. and Young et al. further detailed IS  
82 frameworks that registered dietitian nutritionists (RDNs) can use to incorporate evidence-based  
83 guidelines into their practice.<sup>17, 18</sup>

84

85 In addition to these foundational papers, the Society for Implementation Science in Nutrition  
86 (SISN) was created in 2016 with funding from the Bill and Melinda Gates foundation to provide  
87 IS resources to members of the nutrition community, specifically to support implementation of a  
88 program targeting anemia in women in Uganda and Kenya.<sup>19</sup> From this beginning, SISN now  
89 offers an IS system toolkit for nutrition educators and researchers new to IS, webinars that  
90 provide examples of incorporating IS into nutrition practice and education, and connection to

91 events hosted by other IS organizations, like the Society for Implementation Science Research  
92 Collaboration.<sup>19</sup>

93

94 *To move evidence-based teaching strategies into dietetics higher education.* Furthermore, IS is  
95 gaining traction in higher education to advance use of evidence-based teaching strategies; and  
96 resources have been published to provide educators and researchers with key IS frameworks and  
97 tools to conduct this work in their unique setting.<sup>1</sup> However, use of IS in dietetics higher  
98 education and training of future RDNs is limited. While IS components are often incorporated  
99 into dietetics teaching and program administration, there is a general lack of consistency in the  
100 tools/frameworks used to document and report IS components, leading to challenges in  
101 generalizing findings and reproducing methods.<sup>1</sup>

102

103 This lack of consistency in IS reporting tools and platforms is major barrier to continued and  
104 increased use of IS in dietetics education.<sup>1</sup> In addition, large-scale IS studies can be labor-  
105 intensive, presenting a barrier to settings with limited personnel resources. The aim of the  
106 following sections is to help readers overcome these common barriers to incorporating IS into  
107 their dietetics education programs and ultimately move forward the IS initiative in dietetics  
108 education.

109

## 110 **Opportunities to Incorporate Implementation Science into Dietetics Education**

111

112 IS can and should be utilized across all areas of dietetics education and training. Examples of  
113 ways to incorporate IS into teaching or program administration are provided below. While  
114 programs may already incorporate some or all of the evidence-based strategies discussed in the  
115 following sections, standardized documentation of the implementation process and outcomes is  
116 imperative to guide future implementation, particularly in new programs and program types like  
117 FEM programs.

118

### 119 *Didactic Setting*

120

121 In the didactic setting, as in other traditional higher education settings, IS can help instructors  
122 integrate evidence-based teaching and pedagogical strategies into their classrooms.<sup>4,5</sup> Table 1  
123 below provides examples of evidence-based teaching strategies that could be used to meet  
124 Accreditation Council for Education in Nutrition and Dietetics (ACEND) Knowledge  
125 Requirements for RDNs (KRDNs), and how IS could be used to implement these strategies.

126

127 In their publication on adapting IS for higher education, Soicher et al.<sup>1</sup> provide a useful  
128 adaptation of a CONSORT diagram that reports components of the RE-AIM (Reach,  
129 Effectiveness, Adoption, Implementation, and Maintenance) framework developed by Glasgow  
130 et al. to standardize reporting of the implementation process, as well as key implementation  
131 outcomes of interest.<sup>20,21</sup> In this adapted CONSORT diagram, educators and researchers are  
132 prompted to report the number of students *reached* by an evidence-based teaching strategy  
133 compared to the number of eligible students. For example, a university may offer the same class  
134 in a flipped classroom format and a traditional format. Students may be informed of the different  
135 classroom formats prior to registration, and educators could compare the number of students that  
136 register for the flipped classroom versus the traditional format. Similarly, a university may

137 document the number of faculty who chose to *adopt* and *maintain* an evidence-based teaching  
138 strategy, compared to the number of “eligible” faculty who chose not to adopt and/or maintain  
139 that strategy. Students’ grades in the flipped versus traditional classroom formats could be  
140 compared to evaluate the *effectiveness* of the flipped classroom strategy, along with reports of  
141 student (and instructor) satisfaction with the strategy. Lastly, the RE-AIM framework can guide  
142 documentation of the implementation process, with a focus on fidelity of *implementation* per  
143 protocol, as well as documentation of any adaptations/deviations from the protocol.

Journal Pre-proof

Table 1 Implementation Science Examples for the Didactic Dietetics Setting

		Implementation Science Factor		
2022 KRDN	Evidence-based Teaching Strategy	Determinants	Strategies	Outcomes
Domain 1 (KRDNs 1.1-1.3): Integration of scientific information and research into practice	Flipped Classrooms <sup>22</sup>	<ul style="list-style-type: none"> <li>Instructor time to re-design course to flipped format</li> <li>Student engagement with flipped format (time spent on readings/activities out of class and engagement in in-class discussion)</li> <li>Class size</li> </ul>	<ul style="list-style-type: none"> <li>Collaboration with instructional designer to assist with course re-design<sup>22</sup></li> <li>In-class activities' dependence on out-of-class work<sup>22</sup></li> <li>Utilization of teaching assistants to assist with large classes<sup>22</sup></li> </ul>	<ul style="list-style-type: none"> <li>Student and instructor satisfaction with course</li> <li>Student learning outcomes (exam/quiz/project grades, critical thinking)</li> <li>Instructor's perceived feasibility and sustainability</li> <li>Future course enrollment</li> </ul>
Domain 3 (KRDN 3.1): Development and delivery of information, products and services	Case Studies <sup>23</sup>	<ul style="list-style-type: none"> <li>Funds to purchase case study texts or instructor experience to create original, up-to-date case studies</li> <li>Class size</li> </ul>	<ul style="list-style-type: none"> <li>Collaboration with practicing RDNs to create original case studies</li> <li>Utilization of teaching assistants to assist with grading in large classes</li> </ul>	<ul style="list-style-type: none"> <li>Student satisfaction with case study assignments</li> <li>Student learning outcomes <ul style="list-style-type: none"> <li>Case study grade</li> <li>Preceptor/employer feedback on student preparedness</li> </ul> </li> <li>Instructor's perceived feasibility and sustainability</li> </ul>
Domain 3 (KRDNs 3.3-3.4)	Mock/Simulation Exercises <sup>23</sup>	<ul style="list-style-type: none"> <li>Equipment/actors needed for simulation</li> <li>Instructor time to develop cases/scenarios</li> <li>Instructor time/expertise for</li> </ul>	<ul style="list-style-type: none"> <li>Equipment grants</li> <li>Collaboration with nursing/exercise science/theater departments</li> </ul>	<ul style="list-style-type: none"> <li>Student satisfaction with exercises</li> <li>Student self-efficacy/confidence</li> <li>Student learning outcomes <ul style="list-style-type: none"> <li>Performance on exercise</li> </ul> </li> </ul>

	case/scenario debrief	<ul style="list-style-type: none"> <li>○ Preceptor/employer feedback on student preparedness</li> <li>● Feasibility and sustainability of grants and collaborations</li> </ul>
All Domains/ Application-focused KRDNs	Experiential Learning <sup>23, 24</sup>	<ul style="list-style-type: none"> <li>● Clinical/community/food service/management sites/preceptors/mentors available</li> <li>● Other colleges/universities utilizing same sites</li> <li>● Establishment of strong community collaborations</li> <li>● Designated faculty or faculty load for establishing and maintaining community relations (e.g., program coordinator)</li> <li>● Utilization of telehealth/remote work</li> <li>● Student learning outcomes <ul style="list-style-type: none"> <li>○ Performance in experiential learning practicum</li> <li>○ Preceptor/mentor feedback on student growth during practicum</li> </ul> </li> <li>● Reach of experiential learning opportunities (% of students able to place in sites, % of available sites taking students)</li> </ul>

#### 144 *Supervised Practice Setting*

145

146 In addition to the traditional didactic classroom setting, IS is arguably even more important to  
147 incorporate in the development and administration of supervised practice programs, whether they  
148 be on-site internships alone, distance internships alone, coordinated undergraduate  
149 degree/internship programs, or combined internship/graduate degree programs.

150

151 A major focus of IS is studying how to implement the core components of an  
152 intervention/program as they were intended to be implemented in order to get the desired  
153 outcomes observed in prior efficacy and effectiveness research.<sup>25</sup> This focus aligns with the  
154 design and evaluation of supervised practice dietetic internship programs set by ACEND.  
155 Dietetic internships are based on core competencies (CRDNs) that interns must meet in order to  
156 be prepared for a position as an entry-level RDN. Still, the contexts in which dietetic interns  
157 develop competence in these areas varies widely, while the need to successfully meet these  
158 competencies remains. IS is poised to bridge this gap between varied contexts and necessary  
159 outcomes, as it can guide the implementation of dietetic internship programs by program  
160 directors and other faculty/staff/preceptors.

161

162 Many dietetic internship programs include projects that, when completed by the dietetic intern,  
163 will exhibit their competence in the CRDNs that project is designed to meet. These projects  
164 facilitate experiences that meet the required CRDNs across a variety of contexts. Naturally, the  
165 experiences and projects through which an intern develops competence in a required area will  
166 differ from one intern to the next. IS is helpful in these cases, as frameworks exist to guide  
167 systematic program adaptations to ensure that fidelity to the core components of the program  
168 remain, while guiding future program implementation. Documenting these program adaptations  
169 is imperative and a central value of IS, as researchers and educators cannot assume that after  
170 adapting an evidence-based intervention, program, or teaching strategy, that it will produce the  
171 same outcomes. Systematically documenting adaptations through frameworks such as the one  
172 presented below can guide interpretation of outcomes when a particular adaptation has been  
173 made.

174

175 An example of a framework that can guide documentation of program adaptations is FRAME  
176 (Framework for Reporting Adaptations and Modifications-Enhanced).<sup>26</sup> Even small evaluations  
177 of implementation of supervised practice programs, and documentation of adaptations made  
178 using frameworks such as FRAME, can be instrumental to maintaining and advancing the quality  
179 of supervised practice programs across the U.S.

180

181 For example, the new 2022 CRDN 3.5 statement requires dietetic interns to “Explain the steps  
182 involved and observe the placement of nasogastric or nasoenteric feeding tubes; if available,  
183 assist in the process of placing nasogastric or nasoenteric feeding tubes.” However, depending on  
184 the size of the clinical setting and its scope, including RDN scope, in which a dietetic intern  
185 completes their clinical rotation(s), this opportunity may not be available. Thus, programs may  
186 have to make adaptations to how interns will gain this experience, such as a collaboration with  
187 campus nursing departments to complete a nasogastric tube placement simulation. Program  
188 directors can easily document this adaptation using the FRAME framework, consistent with  
189 documentation in other health professions and as seen in Figure 1 below.<sup>27</sup>

190

**Figure 1 FRAME documentation of CRDN 3.5 implementation**

WHEN did the modification occur?

- Pre-implementation
- During planning of transition to 2022 ACEND standards

Were adaptations planned/proactive or unplanned/reactive?

- Planned/proactive
- Lack of resources driving need for adaptation was present at the beginning

WHO determined that the modification should be made?

- Program director, assistant director, and preceptors who do not have feeding tube placement in their facility's scope of practice

WHAT is modified?

- Context/setting in which CRDN is met
- Clinical sites do not allow RDs to place feeding tubes, so intern experience will be met through a simulation exercise in collaboration with the university's nursing department

At what level of delivery is the modification made?

- Individual-level
- Interns placed in a clinical facility that do not allow RDs to place feeding tubes

Type or nature of the context or content-level modifications?

- Substituting setting in which CRDN is met
- Simulation lab in place of clinical facility

Extent to which the modification is fidelity-consistent?

- Fidelity consistent/core elements or functions preserved

Reasons for modification, including 1) intent or goal of modifications and 2) contextual factors that influenced decision

- 1) to improve feasibility of meeting CRDN in programs located in areas with facilities that limit RDs' scope of practice
- 2) policies of external facilities in which interns are placed

191

192

193 *Future Education Model*

194

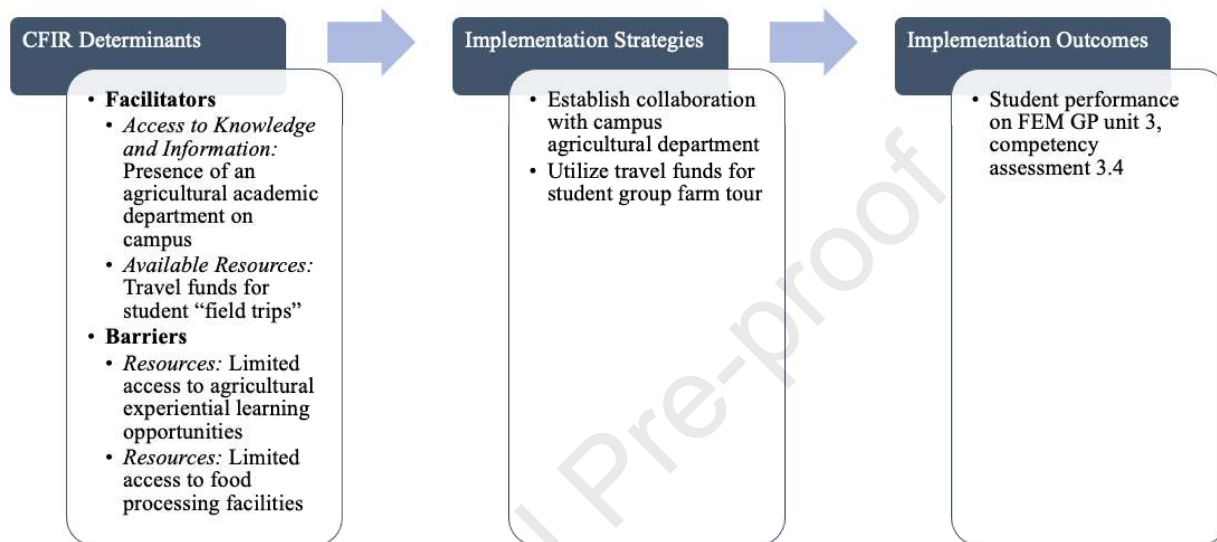

195 A major topic of discussion in dietetics education is the new Future Education Model (FEM),  
 196 with numerous demonstration programs now operating to determine the effectiveness of the  
 197 model for future dietetics education. While effectiveness of FEM programs is still to be fully  
 198 determined following implementation of the current demonstration programs, it is imperative  
 199 that implementation of these programs also be evaluated in addition to their effectiveness. If  
 200 demonstration program outcomes are positive and ACEND decides to transition accredited  
 201 programs to FEM APs, BPs and GPs in the future, education and training of future RDNs will  
 202 suffer without proper guidance and "lessons learned" from implementation of current  
 203 demonstration programs.

204

205 A variety of IS frameworks would be appropriate to use to evaluate implementation of FEM  
 206 demonstration programs. One of the more commonly used frameworks, especially in evaluation  
 207 of higher education programs, is the Consolidated Framework for Implementation Research  
 208 (CFIR).<sup>1,7</sup> The CFIR is a helpful framework for identifying barriers to and facilitators of  
 209 implementation and implementation outcomes, which can inform the development of strategies  
 210 to improve future implementation of the program of interest. Implementation barriers and  
 211 facilitators can be identified through documentation by the program director and other program

212 administrative faculty/staff, as well as through interviews, focus groups, and/or surveys with  
 213 program stakeholders (faculty, preceptors, students, college/university administration). A variety  
 214 of tools to make use of the CFIR easier are available on the CFIR website.<sup>28</sup> An example of how  
 215 the CFIR might be used to identify implementations barriers to and facilitators of meeting FEM  
 216 GP unit 3, competency assessment 3.4, “Applies and demonstrates an understanding of  
 217 agricultural practices and processes (Show),” is presented in Figure 2 below.  
 218

**Figure 2 CFIR determinants of FEM GP unit 3, competency assessment 3.4**

219 Evaluation of implementation with frameworks like the CFIR can be conducted alongside  
 220 effectiveness evaluations through hybrid effectiveness-implementation trials.<sup>29</sup> These hybrid  
 221 designs are encouraged in many instances, as they minimize the research-to-practice (or, in the  
 222 case of dietetics education programs, research-to-education) gap and promote more rapid,  
 223 effective implementation of evidence-based approaches.  
 224  
 225  
 226

### 227 Call to Action

228  
 229 For dietetics educators new to IS, incorporating IS into their teaching and program  
 230 administration may not seem feasible. However, because of the evidence supporting the value of  
 231 IS for maximizing effectiveness of dietetics teaching and practice, overcoming barriers to use of  
 232 IS is imperative.<sup>30, 31</sup> It is likely that many are already incorporating informal pieces of IS into  
 233 their teaching and program evaluation. Actions as simple as surveying students after  
 234 implementation of a new teaching strategy or asking preceptors simple interview questions  
 235 during site visits can provide valuable feedback on how to improve implementation. The  
 236 Nutrition Educators for Health Professionals (NEHP) and Nutrition and Dietetic Educators and  
 237 Preceptors (NDEP) Dietetic Practice Groups offer numerous platforms to share the results of IS  
 238 factors like these in order to advance dietetics education as a whole. Furthermore, publication of  
 239 IS research in dietetics journals will play a key role in closing the knowledge gap on  
 240 incorporating IS into dietetics education.

**Figure 1 FRAME documentation of CRDN 3.5 implementation**

WHEN did the modification occur?

- Pre-implementation
- During planning of transition to 2022 ACEND standards

Were adaptations planned/proactive or unplanned/reactive?

- Planned/proactive
- Lack of resources driving need for adaptation was present at the beginning

WHO determined that the modification should be made?

- Program director, assistant director, and preceptors who do not have feeding tube placement in their facility's scope of practice

WHAT is modified?

- Context/setting in which CRDN is met
- Clinical sites do not allow RDs to place feeding tubes, so intern experience will be met through a simulation exercise in collaboration with the university's nursing department

At what level of delivery is the modification made?

- Individual-level
- Interns placed in a clinical facility that do not allow RDs to place feeding tubes

Type or nature of the context or content-level modifications?

- Substituting setting in which CRDN is met
- Simulation lab in place of clinical facility

Extent to which the modification is fidelity-consistent?

- Fidelity consistent/core elements or functions preserved

Reasons for modification, including 1) intent or goal of modifications and 2) contextual factors that influenced decision

- 1) to improve feasibility of meeting CRDN in programs located in areas with facilities that limit RDs' scope of practice
- 2) policies of external facilities in which interns are placed

**Figure 2 CFIR determinants of FEM GP unit 3, competency assessment 3.4**
