ABSTRACT

Jill O. Hathaway, MCLASS: READING 3D—UTILIZATION OF STUDENT DATA TO DETERMINE INSTRUCTIONAL PRACTICES (Under the direction of Dr. William Grobe). Department of Educational Leadership, March 2015.

This dissertation is a program evaluation of a state-mandated early reading assessment program, titled mClass: Reading 3D, implemented in K–3 classrooms in a rural public school system in North Carolina. The purpose of this study was to research the following question: To what extent, if any, do teachers use student data to determine instructional practices that may impact student achievement?

Data were collected from teacher surveys, principal and instructional coach interviews, and student test scores to determine the impact of mClass: Reading 3D on student reading achievement in second grade. The findings of this study revealed that mClass: Reading 3D had “no positive” impact on student test scores after two years of implementation. However, mClass: Reading 3D has impacted instructional practices in the following areas:

- Better utilization of data to improve student achievement
- Improvements in differentiation, small group instruction, accountability, rigor, and utilization of teacher assistants

The conclusions suggested there is a need for more specific and ongoing professional development to improve program implementation and fidelity. Other conclusions focused on the enhancement of mClass: Reading 3D data through teacher support and facilitation of literacy. The need for a reading specialist at every school and the removal of mClass: Reading 3D from third-grade classrooms are some of the recommendations provided for program improvement.

DIRECTOR OF DISSERTATION:                      William Grobe, EdD

COMMITTEE MEMBER:                                        William A. Rouse, Jr., EdD

COMMITTEE MEMBER:                                        James McDowelle, EdD

COMMITTEE MEMBER:                                        Zoe Locklear, EdD

COMMITTEE MEMBER:                                        Linda Emanuel, EdD

CHAIR OF THE DEPARTMENT OF EDUCATIONAL LEADERSHIP

                                                      William A. Rouse, Jr., EdD

DEAN OF THE GRADUATE SCHOOL:

                                                      Paul Gemperline, PhD
DEDICATION

This dissertation is dedicated to my family who said, “Go for It” when I wanted to pursue a doctorate degree while working full time. “Thank you” to my parents, Martin and Frances, for loving me unconditionally and providing me with direction and advice throughout my life. Your encouragement and love have blessed me with the strength needed to succeed this whole process.

“Thank you” to my husband and best friend, Joel, who has been patient with me as I spent numerous hours working on this study. I am also eternally grateful to you for supporting my decisions to pursue every goal I dreamed of and for always believing that I can achieve them. You have been with me every step of the way. You are wonderful for “putting up with it all.” I love you today and always.

Finally, “thank you” to my sons, Kyle and Corey, for always being in my corner and enriching my life in so many ways. I love you more than words can ever say. Being your “mom” is my proudest moment and greatest accomplishment. You have truly taught me more than I could ever teach you. May this dissertation inspire you to stay focused and keep working even when you want to give up. Life is full of challenges. Therefore, always “begin” any task with the “end” in mind. Success awaits you both.
ACKNOWLEDGEMENTS

I would like to thank my colleagues and dear friends, Darlene B. Cummings and Sheri Dial Herndon, who walked through every step of this process with me and never let me give up. I could not have accomplished this without you, and I will forever be grateful to you for your encouragement and support.

Also, I would also like to acknowledge my deep gratitude to my dissertation chair, Dr. William Grobe, along with my committee: Dr. Art Rouse, Dr. Zoe Locklear, and Dr. Linda Emanuel. Thank you all for your guidance, encouragement, and feedback during this exciting process. Your commitment to helping others reach their goals is an admirable quality and gift from above. I am forever indebted.

Much appreciation is extended to Dr. Johnny Hunt, Superintendent of Public Schools of Robeson County. Without your cooperation, this study would not have been possible. Thank you for sharing your personal dissertation experiences and tribulations. Your stories brought much comfort and inspiration especially through difficult periods of time throughout this journey.

Next, I would like to thank my editor, Dr. Richard Allen, who maintained flexibility and punctuality throughout the whole process. You are definitely deserving of the impeccable reputation you have earned from various doctoral students and colleagues. You also never complained about last minute notices and short deadlines. Your level of skills and knowledge are untouchable. I am eternally appreciative of you.

Also, having a great support system of family and friends (especially Delois and Melba) contributed greatly to the completion of this study. My family and friends are an outstanding
source of comfort who are always willing to lend a hand whenever possible. You are all the best, and I love you for being there for me.

Last, but not least, the staff of Piney Grove Elementary School is deserving of special recognition for sticking with me through this voyage. It is not easy leading a school and working on a doctorate at the same. Working with a great group of educators who are committed to “making a difference” is a wonderful asset for any principal. Thank you all.

CHAPTER 1: INTRODUCTION

The purpose of this study was to explore the relationship that exists between the history of reading, the impact of mClass: Reading 3D on student achievement in second grade, and the impact of quality professional development through a program evaluation. It was the intention that the data from this study be used to improve the implementation process of mClass: Reading 3D that may have a direct impact on student achievement. This dissertation is a program evaluation of a state-mandated early reading assessment program implemented in K–3 classrooms in a rural public school system in North Carolina. Chapter 1 provides background information for implementing the mClass: Reading 3D Assessment Program in three selected public elementary schools in one school district. mCLASS: Reading 3D is a reading assessment software program that uses a running record to diagnose reading comprehension of students enrolled in grades K-5 (Amplify Education, Inc., 2014a).

The Need for Study

Prior to the adoption of mClass: Reading 3D, K–2 teachers in the State of North Carolina assessed reading skills using a running record. A running record is a tool developed by New Zealand educator Marie Clay that helps teachers identify patterns in student reading behaviors and serves as a way to precisely observe, record, and carefully analyze reading behaviors (Tierney & Readence, 2005). These patterns allowed a teacher to see the strategies a student uses to make meaning of individual words and texts as a whole. Running records, when paired with comprehension inquiry, can be used to identify an instructional reading level for individual students. While running records are a diagnostic tool, they can and should be used to inform instruction and to help extend a reader’s use of strategies (Gunther, 2013). Clay (1993) provides detailed information for using a running record to analyze strategies. Running records allowed
Prior to the state mandated implementation of the mClass: Reading 3D assessment, no diagnostic standardized assessment program was used to evaluate students’ reading achievement in grades K-2. The K-2 reading assessments that were being used throughout the state failed to meet the requirements of newly mandated state and federal initiatives such as Race to the Top and Read to Achieve. For example, goals and expectations of these K–2 assessments did not align with goals and expectations of the state-developed end-of-grade (EOG) reading test given to students in grade three to measure academic growth and proficiency levels. Further, the state did not include letter and sound identification in the 2005 NC K-2 literacy assessment (North Carolina Department of Public Instruction [NCDPI], 2009). Since many schools and districts were including this component in locally developed assessments, letter and sound identification was added to the 2009 revised literacy assessment produced by the state as a strategy to improve reading skills (NCDPI, 2009). This component yielded information for planning and classroom instruction.

Book and print awareness was primarily used as a kindergarten assessment in 2005 (NCDPI, 2009). The North Carolina K-2 assessment, which was revised in 2009, included a book with a matching script as a component of the assessment. This was to be used during the first two years of school to ensure assessed skills were aligned with the North Carolina Standard Course of Study (NCDPI, 2009). Phonemic awareness was originally designed for use in grades K-1. However, beginning in 2009, the state also required the assessment in grades K-2.

The running record contained leveled books to be used for fluency assessment. To enhance oral retell, the NC K-2 revised assessment included the same rubric descriptors for
fiction and nonfiction text (NCDPI, 2009). Comparing a student’s assessment in grade three to his/her assessment in grade two was much like comparing apples to oranges and was quite problematic. Furthermore, many educators stated that running records and K–2 assessments allowed too much teacher subjectivity and judgment, unlike the Grade 3 EOG. Therefore, many times this subjectivity led to a huge discrepancy between the performances of a student enrolled in K–2 as compared to third grade. By the end of the 2009–2010 school year, only 59% of third-grade students taking the NC End-of-Grade reading test scored at or above Level III proficiency (NCDPI, 2010b).

An assessment gap definitely exists in U.S. schools. Schools are struggling to enable students to attain the advanced literacy skills required for the 21st century American economy (Haskins, Murnane, Sawhill, & Snow, 2012). Ralph Smith, Executive Vice President of the Annie E. Casey Foundation stated, “We will never close the achievement gap, we will never solve our dropout crisis, we will never break the cycle of poverty that afflicts so many children if we don’t make sure that all our students learn to read” (as cited in Annie E. Casey Foundation, 2013b). Furthermore, to the detriment of the child, many times student reading deficiencies failed to be diagnosed until grade three. Essentially, 70% of students who reach age nine and who cannot read will remain illiterate (Shaywitz, 2005). Eamon (2002) found that households experiencing poverty provide a less cognitively stimulating environment, which is somewhat associated with lower achievement scores. Neuman and Celano (2001) reported that summer breaks for students from families with less income can mean less access to libraries, bookstores, camps, and literate experiences.

The gap between strong and struggling readers increases significantly as children progress through school, according to a study of 382 children by Canadian researchers. The study found that as students progressed from kindergarten to grade three, those in the lower ranks of reading achievement were likely to remain there. Moreover, at each
subsequent data collection point over a four-year period, the struggling readers fell further behind their grade-level reading peers. (Fiester, 2013, p. 4)

A real need exists to develop and build students’ reading capacity during the primary and elementary years in order to prepare students to meet the reading challenges posed by heavy content and extensive curriculum requirements at the secondary level. Therefore, kindergarten, first, second, and third-grade students shall be assessed with valid, reliable, formative, and diagnostic reading assessments made available to local school administrative units by the NC State Board of Education (NC General Assembly, 2012).

Deficiency in reading achievement starts early and accelerates over the course of a student’s school experience (Keiser, 2011). Reading expectations increase as students leave elementary school and enter middle grades where they will face complex content-based informational texts. If teachers do not intervene and diagnose reading deficiencies early and appropriately, students who enter middle school as unsteady readers have a greater chance of becoming struggling readers (Sturtevant, 2003).

Since the passage of the No Child Left Behind Act in 2001, more and more states are implementing statewide assessments. This act included a requirement that all children would be proficient in reading and mathematics by the 2013–2014 school year (U.S. Department of Education, 2010c). Schools and districts are held accountable for students’ mastery of state academic content standards. The stakes are high since both federal and state legislation required tough sanctions for students, teachers, and school districts if they perform poorly on the new assessments. Federal mandates forced state and local education agencies to implement aggressive accountability measures to improve low test scores associated with reading deficiencies. For example, the North Carolina General Assembly’s Read to Achieve Policy was
enacted to ensure that every student reads at or above grade level by the end of third grade (NCDPI, 2012).

There was a need to research North Carolina’s adoption of mClass: Reading 3D to determine program effectiveness and its impact in the selected public school district. This study attempted to determine the extent to which mClass: Reading 3D has impacted students’ reading achievement in second grade, and determine how teachers use student data from the program to identify instructional practices that may impact student achievement. Additionally, the researcher analyzed collected data to report, if and how, continuous and ongoing professional development associated with mClass: Reading 3D provided teachers with the necessary skills to effectively impact students’ reading achievement.

**Statement of the Problem**

The decline in third-grade North Carolina End-of-Grade reading scores has placed an increased emphasis on improving reading achievement of students in grades kindergarten through second grade. These diminishing student achievement scores, based on state standardized achievement tests, have resulted in a sense of urgency for public school districts in North Carolina to implement a diagnostic reading assessment program to improve student performance (NC School Report Card, 2013). These concerns have led to the adoption of mClass: Reading 3D across the State of North Carolina to meet local and state mandates, as outlined in the Read to Achieve Policy (NCDPI, 2012).

**Purpose of the Study**

The purpose of this study was to explore the relationship that existed between the history of reading instruction, the impact of mClass: Reading 3D on student achievement in second grade, and the impact of quality professional development through a program evaluation. Data
from this study were used to inform the implementation process of mClass: Reading 3D that may a positive impact on students’ reading achievement. Specifically, the study attempted to address the following question:

To what extent, if any, do teachers use student data to determine instructional practices that may impact student achievement?

Additionally, other questions relating to this study continuously surfaced that greatly affect student data to determine instructional practices that may impact student achievement. The reoccurring questions were the following:

- To what extent, if any, has mClass: Reading 3D impacted students’ reading achievement in second grade?
- To what extent, if any, did continuous and ongoing professional development associated with mClass: Reading 3D provide teachers with the necessary skills to impact students’ reading achievement?

**Significance of the Study**

The importance of reading and becoming literate cannot be overstated (Snow, Burns, & Griffin, 1998). Learning to read is one of the most important abilities a student can acquire (Kirk, 1999; Reitzhammer, 1990). Students who do not learn to read as expected are less likely to complete high school (Morris, Shaw, & Perney, 1990; Reitzhammer, 1990; Shanahan & Barr, 1995). With increased expectations for accountability for student success (Bailey, 2002), schools are faced with finding alternative methods to improve student achievement. The study described here has the potential to add to the body of research regarding the use or effectiveness of mClass: Reading 3D to improve student reading in rural North Carolina public schools. Data were collected and analyzed from surveys, interviews, and the mClass: Reading 3D results
collected from beginning of year (BOY), middle of year (MOY), and end of year (EOY) reports from students in grade two from the 2012–2013 school year in the selected elementary schools. This descriptive study sought greater understanding of how mClass: Reading 3D impacts students’ reading achievement in second grade; how teachers use data to drive instructional practices; and to what extent professional development provided teachers with the necessary skills to effectively impact students’ reading achievement. Results may help schools assess time and effort regarding the implementation of mClass: Reading 3D. Teachers and administrators have the opportunity to collaborate in the development of continuous improvement processes that include the analysis of data to guide and transform instruction, inform ongoing professional development and support, and reduce the achievement gap (Amplify Insight, 2013).

**Overview of Methodology**

This study was a program evaluation of mClass: Reading 3D utilizing descriptive statistics as the methodology. Green and Carracelli (1997) indicated that qualitative and quantitative are used to gain a greater understanding or picture of the construct of interest. According to Creswell (2009), the descriptive study approach gives overall strength to a study, making this approach greater than either qualitative or quantitative research. Yin’s (2009) research stated that a descriptive study using a program evaluation allows researchers to address more complicated research questions and collect a richer and stronger amount of evidence than can be provided in a study using one method. Quantitative data includes closed-ended information that may be obtained from attitude, behavior, or performance instruments. This analysis consists of analyzing scores collected on instruments, checklists, or public documents to answer research questions. On the other hand, a qualitative study consists of open-ended information the researcher gathers through interviews, observations, or gathering documents or
artifacts. Data is typically analyzed into themes or categories of information. This qualitative study closely examined how mClass: Reading 3D was implemented and how effective the implementation has been to guide instruction to improve student reading achievement.

**Definitions of Terms**

This program evaluation used various terms to accurately describe the research. Terms defined here will be used throughout this dissertation.

*Adult learning*—“The process of adults gaining knowledge and expertise” (Knowles, Holton, & Swanson, 2005, p. 174).

*Assessment*—Refers to the “specification and verification of problems for the purpose of making different kinds of decisions” (Salvia & Ysseldyke, 1998, p. 22).

*Average Daily Membership (ADM)*—The sum of the number of days in membership for all students in individual Local Education Agencies (LEAs), divided by the number of school days in the term (NCDPI, 2013a).

*BOY (Beginning of Year)*—Time of year mClass: Reading 3D assessment is administered (PB Works, 2013). BOY assessments usually occur in September. BOY assessments are part of mClass: Reading 3D benchmark assessments.

*Cut score*—“The minimum score required for performance at each National Assessment of Educational Progress (NAEP) achievement level. NAEP cut scores are determined through a standard-setting process that convenes a cross-section of educators and interested citizens from across the nation. The group determines what students should know and be able to do relative to a body of content reflected in the framework. The National Assessment Governing Board then adopts a set of cut scores on the scale that defines the lower boundaries of Basic, Proficient, and Advanced” (National Center for Education Statistics [NCES], 2013b, “Cut score”).
Daze—A new measure in DIBELS Next used to measure the reasoning processes that constitute comprehension and assess the student’s ability to construct meaning from text using word recognition skills, background information and prior knowledge, familiarity with linguistic properties such as syntax and morphology, and cause-and-effect reasoning skills. Daze serves as the standardized, DIBELS version of maze procedures for specifically measuring reading comprehension (Amplify Education, Inc., 2013a).

DIBELS—Dynamic Indicators of Basic Early Literacy Skills (DIBELS) are a set of procedures and measures for assessing the acquisition of early literacy skills from kindergarten through sixth grade.

DIBELS Next—Provides two types of testing, benchmark assessment and progress monitoring. Benchmark assessment, or screening, refers to testing all students three times per year for the purpose of identifying those who may be at risk for reading difficulties. Once students are identified as at risk for reading difficulties, they can receive progress monitoring testing more frequently to ensure that the instruction they are receiving is helping them make progress (Dynamic Measurement Group, 2012).

DIBELS Oral Reading Fluency (DORF)—A standardized, individually administered test of accuracy and fluency with connected text. The DIBELS ORF passages and procedures are based on Stan Deno and colleagues’ program of research and development of Curriculum-Based Measurement of Reading at the University of Minnesota (Shelton, Altwerger, & Jordan, 2009).

Early-grade reading—Refers to pre-kindergarten through the third grade, which can be characterized as basic reading skills and perception; later reading is done for comprehension and other higher-level tasks (Chall, 1967).
EOY (End of Year)—Time of year mClass: Reading 3D assessment is administered (PB Works, 2013). EOY assessments usually occur in May.

First Sound Fluency (FSF)—Standardized, individually administered test of phonological awareness. The FSF measure assesses a student's ability to segment one, two, or three syllable words into their individual phonemes fluently. The FSF measure has been found to be a good predictor of later reading achievement (Nelson, 2003).

Formative assessment—Use of observational or diagnostic measures to provide detailed information about a student’s progress. Formative assessments provide teachers with frequent data regarding the growth and development of students. The purpose of this data is to allow teachers to plan appropriate differentiated small group instruction that will meet the needs of each student. Collecting data for formative types of assessment can be done in a variety of ways. According to T. H. Wang (2008), “Formative assessments play an important role in both the traditional learning environment and the e-Learning environment” (p. 1,249). Traditionally, this has been a paper-pencil type of data collection. However, Wireless Generation offers a way to collect this data electronically, which speeds up the delivery of that data analysis for each child. For this study, formative assessment, also called progress monitoring is defined as, “a probe used between benchmarks to target specific content areas for remediation” (Reaves & O’Sullivan, 2010, p. 38).

Governance—The shared power of planning, administering, and implementing an action; incorporates components such as responsibility for developing, designing, evaluating, and handling academic matters (Diamond, 2002).

Initial Sound Fluency (ISF)—A standardized, individually administered measure of phonological awareness that assesses a child's ability to recognize and produce the initial sound
in an orally presented word (Kaminski & Good, 1996, 1998). The ISF measure is a revision of the measure formerly called Onset Recognition Fluency (OnRF).

*Large-scale standardized reading assessment*—Refers to state or national assessments on reading that are administered to all participants in the same conditions and manner (Wheeler & Haertel, 1993).

*Letter Naming Fluency (LNF)*—Standardized, individually administered test that provides a measure of risk, based on research by Marston and Magnusson (1988). Students are presented with a page of upper- and lower-case letters arranged in a random order and are asked to name as many letters as they can. Students are told if they do not know a letter, they will be told the letter. The student is allowed 1 minute to produce as many letter names as he/she can, and the score is the number of letters named correctly in 1 minute.

*Literacy*—Literacy is hard to define and ever changing. It is a shifting target that will continue to change over time. What it meant to be literate a few decades ago no longer holds true today. Past definitions used included learning to read and sounding out words from traditional texts (AACTE, 2008). For the purpose of this study, literacy will be used as a broader term. In order to be literate in the 21st century, students must be able to successfully collaborate and communicate through various types of media. Literacy teachers will be expected to change with new technologies and be able to support a variety of resources in order to meet the needs of young aspiring readers (Clay, 2001a).

*mCLASS®: Reading 3D*—A key program to understand in this study. According to amplify.com, mClass: Reading 3D is a validated, research-based assessment that combines quick indicators of early skill development and deeper observations of student interaction with authentic text. Components included screen, diagnose, and individualize instruction for, and
track all K–5 students at every stage of reading development in efforts to give a comprehensive view of each student’s reading development (Wireless Generation, n.d.). Essentially, Reading 3D uses multiple formative assessments electronically in order to isolate skills and ensure mastery. Because these assessments are taken electronically, the analysis from the assessment data are available to the teacher instantaneously by accessing their data on a web server.

*mClass: Reading 3D Benchmark Assessments*—assessments that are administered three times a year (Beginning of Year [BOY], Middle of Year [MOY], and End of Year [EOY]) to identify students who require reading support and intervention, and to find a student’s instructional reading level. All measures are used as benchmark assessments” (Amplify Education, Inc., 2014b, “Assessment Overview,” para. 1).

*MOY (Middle of Year)*—Time of year mClass: Reading 3D assessment is administered (PB Works, 2013). MOY assessments usually occur in January.

*No Child Left Behind (NCLB)*—On January 8, 2002, President Bush signed into law the No Child Left Behind Act of 2001. The Act is the most sweeping reform of the Elementary and Secondary Education Act (ESEA) since ESEA was enacted in 1965. It redefines the federal role in K–12 education and will help close the achievement gap between disadvantaged and minority students and their peers. It is based on four basic principles: stronger accountability for results, increased flexibility and local control, expanded options for parents, and an emphasis on teaching methods that have been proven to work (NCDPI, 2013a).

*Nonsense Word Fluency (NWF)*—A standardized, individually administered test of the alphabetic principle including letter-sound correspondence in which letters represent their most common sounds and of the ability to blend letters into words in which letters represent their most common sounds (Kaminski & Good, 1996).
**Pedagogy**—The art or method of teaching (Pedagogy, 2014).

**Phoneme Segmentation Fluency (PSF)**—A standardized, individually administered test of phonological awareness (Kaminski & Good, 1996). The PSF measure assesses a student's ability to segment three- and four-phoneme words into their individual phonemes fluently and has been found to be a good predictor of later reading achievement (Kaminski & Good, 1996).

**Professional development**—As defined by the National Professional Development Council (2000), is “a lifelong collaborative learning process that nourishes the growth of individuals, teams, and the school through a daily job embedded, learner-centered, focused approach” (DuFour, DuFour, Eaker, & Many, 2006, p. 217); the learning process that supports and fosters instructionally effective educators; on-the-job teacher training; interchangeable terms generally recognized by the educational community include “in-service,” “staff development,” “teacher training,” “teacher learning,” and “professional learning.”

**Professional learning community (PLC)**—A group of educators, both teachers and administrators, who collaborate to share learning experiences with the intent of improving their instructional effectiveness for the benefit of students (Hord, 1997); sometimes referred to as PLTs (Professional Learning Teams).

**Progress monitoring**—The practice of testing students briefly but frequently on the skill areas in which they are receiving instruction, to ensure that they are making adequate progress (Dynamic Measurement Group, 2012).

**Read to Achieve**—Part of the Excellent Public Schools Act which became law in July of 2012 and applies to all schools at the beginning of the 2013–2014 school year. The purpose of the program is to ensure every child reads at or above grade level by third grade through early
identification and services for reading difficulties, increased parental notification of academic need and progress, and grade promotion based partly on reading proficiency (NCDPI, 2012).

*Self-efficacy*—One’s judgment about his or her capability to complete a task; one’s perception of his or her capacity or power to produce a desired effect (Bandura, 1993).

*Technology*—Generically defined as “tools created by human knowledge on how to combine resources to produce desired products, to solve problems, fulfill needs, or satisfy wants” (AACTE, 2008, p. 5). However, in this case, the technology that is being used for the mClass: Reading 3D program is specific to Wireless Generation specs. Resnick and Berger (2010) described this technology as a “platform that makes it easy for schools and teachers to manage the assessment process and that puts at teachers fingertips, the insights and actions that should follow from assessment data” (p. 3).

**Summary**

In summary, this chapter described the methodology used to guide this descriptive study. The need for this study has been attributed to the huge discrepancy that currently exists in students’ reading performance between K-2 and Grade 3. The statement of the problem addressed a decline in reading proficiency among third-grade students (NCDPI, 2010b) which led to the adoption of the mClass: Reading 3D program. The mClass: Reading 3D assessment identifies the needs of struggling readers to improve reading achievement. The purpose of the study explored the extent to which the mClass: Reading 3D program impacts students’ reading achievement in second grade, the extent teachers use student data to drive instruction, and the extent professional development impacts students’ reading achievement. The study was significant in that the researcher sought to develop a greater understanding of how mClass: Reading 3D impacts students’ reading achievement as it relates to time and effort invested in the
program. The methodology was a program evaluation using descriptive statistics to closely examine how mClass: Reading 3D was implemented and its effectiveness to guide reading instruction. Selected terms were defined in Chapter 1 to describe the research. Limitations have been noted; however, results can be generalized to other schools in the school district.

Chapter 2 provided an extensive review of the literature. Chapter 3 provided a detailed explanation of the procedures and methodologies that were used in this research study. Chapter 4 provided an analysis and explanation of the resulting quantitative and qualitative data. Additionally, the chapter provided a discussion of the findings, conclusions, and recommendations.
CHAPTER 2: REVIEW OF LITERATURE

*Learning to read and write opens doors to progress and prosperity across a lifetime.*
(National Institute for Literacy, 2009)

The purpose of this study was to explore the relationship that exists between the history of reading, the impact of mClass: Reading 3D on student achievement in second grade, and the impact of quality professional development through a program evaluation. Data from this study can be used to improve the implementation process of mClass: Reading 3D that may have a direct positive impact on students’ reading achievement. Specifically, the study obtained data to answer the following question:

*To what extent, if any, do teachers use student data to determine instructional practices that may impact student achievement?*

Additionally, other questions relating to this study continuously surfaced that greatly affect student data to determine instructional practices that may impact student achievement. The reoccurring questions are the following:

- To what extent, if any, has mClass: Reading 3D impacted students’ reading achievement in second grade?
- To what extent, if any, did continuous and ongoing professional development associated with mClass: Reading 3D provide teachers with the necessary skills to impact students’ reading achievement?

This review of literature provided background information relative to mClass: Reading 3D. The history of reading has been explored to include instructional trends, reading initiatives and policies, and the development of the mClass: Reading 3D assessment program. A description of program components has been provided. Research on technology was included to show how student assessment has evolved to meet the demands of 21st century learning.
Additionally, an extensive review of professional development research was included to examine the extent to which teachers are equipped with necessary skills to positively impact students’ reading achievement. Professional development models are outlined to provide a framework of variations relating to teacher training. The program evaluation provided a detailed analysis that may guide the selected school district and state for future recommendations on the implementation and impact of the mClass: Reading 3D assessment.

**Why is Literacy Important?**

What is literacy? The answer lies within the time frame one is referencing throughout history. Most people assume that literacy simply means being able to read and write. However, in today’s complicated and ever changing world, this definition is too simple to adequately define the true meaning of “literacy.”

The development of literacy occurs across the lifespan of the individual from “womb to tomb” (Alexander, 2006). Throughout history, the definition of literacy has taken on different meanings reflecting needs, issues, and concerns relative to the time period. For example, according to Barnhart and Steinmetz (1988), in 1878, Webster defined literate as “learned.” In the 1892 edition of *Webster’s Dictionary of English Language*, the term means “instructed in learning and science.” It is interesting to note that this definition does not mention the act of reading to which literacy was so strongly linked in its origin and is so strongly linked today. Boothe (2006), on the other hand, defines literacy as a “series of processes that can offer us a means, a pathway, to deeper more complex understandings and constructions of our own worlds” (p. 11). A new development in education is determining what “literacy” means in the 21st century (Price, 2013). The definition provided by the Department of Education and Skills (DES) in the National Strategy to Improve Literacy and Numeracy Among Children and Young People
2011–2020 notes that “literacy includes the capacity to read, understand and critically appreciate various forms of communication including spoken language, printed text, broadcast media, and digital media” (DES, 2011, p. 8). Currently, Reading Connections (2013) have defined literacy as “an individual’s ability to read, write, speak, compute and solve problems at levels of proficiency necessary to function on the job, in the family of the individuals, and in society” (para. 1). This definition appropriately applied to the varied contexts taking place in the educational world today. For example, there is functional literacy, cultural literacy, computer literacy, mathematical literacy, scientific literacy, digital literacy, and global literacy. In each of these terms, the word literacy referred to a level of competence.

Literacy is one of the most important foundational skills for success in school and life. Literacy in the 21st century requires much more from a skilled reader than a generation ago. The long-term economic effects of not becoming a good reader and failing to graduate from high school are now more severe. The National Institute for Literacy (2009) reported that our nation of farmers and mechanics has transformed into a different type of society with different needs. As the structure of jobs has changed, along with the economy, occupational and basic literacy skills have become more essential for advancement in the workforce (Kirsh, Braun, Yamamoto, & Sum, 2007). Today’s workforce must be literate to achieve economic, civic, and social success. Literacy has emerged as a key to success in 21st century America. People with higher literacy skills have higher salaries, higher employment rates, higher civic participation, lower public assistance rates, and lower crime rates than people with lower literacy skills (Fiedrich & Jellema, 2003; Kirsch, Braun, Yamamoto, & Sum, 2007; Ohio Literacy Resource Center, 2013; Osberg, 2001).
Literacy skills, a high school diploma, and a college degree were not as important as a generation ago because the economy of the United States was built on agriculture and manufacturing. However, today’s economy is both knowledge-based and globally competitive. Changes are driven by technological advances and globalization (Kirsh et al., 2007). This new economy demands higher literacy skills and creates jobs that require advanced learning (Musen, 2010). Employers need workers who have mastered reading processes that allow them to locate information and use higher-level thinking strategies. Snow et al. (1998) suggest that there is a rising demand for increased literacy to accompany the development of technology and increasing competitiveness in a global knowledge economy.

The National Center for Education Statistics (NCES, 2008) reported the following facts that greatly concern educators, politicians, parents, and employers on a local, state, national, and international level:

- On a national level, American adults (age 16+) function at the lowest literacy level. They are, at best, able to perform tasks involving brief, uncomplicated texts.
- One in seven U.S. adults can’t read this paper.
- Thirty percent of new job applicants fail basic literacy tests given by prospective employers. Sixty-five percent of these are denied employment because they lack the basic reading and/or math skills necessary for the job they sought.
- In North Carolina, more than one million (approximately 22%) adults experience reading and writing difficulties that seriously affect their daily lives and that of their families.
- Compared to the national average, low literacy is higher among adults in North Carolina.
• 80% of the fast growing jobs in the U.S. require some post-secondary education.

• More than 40% of the U.S. workforce and more than 50% of high school graduates do not have basic skills for employment.

• Individuals with low literacy skills have a higher rate of hospitalization and increased incidents of medication and treatment errors than the general public.

• The health care industry estimates that $73 billion per year of necessary health care expense attributes to poor literacy.

• Research demonstrates that low literacy, poor health, and early death are linked.

• Children whose parents have low literacy skills are more likely to become adults with low literacy skills than children whose parents are good readers.

Throughout the K–12 school experience, children continue to build upon prior knowledge to develop grade level academic skills and knowledge. With each additional year, gains in reading are smaller and smaller (Francis, Shaywitz, Stuebing, Shaywitz, & Fletcher, 1996). Francis et al. (1996) stated that students who fall behind in the early grades have a harder time catching up, making it particularly important to identify struggling students as early as possible. Reading improvements are easier to obtain in the early years but harder later on. In other words, there is greater potential for learning reading skills in the early grades. The potential for early rapid learning comes as no surprise to scholars of cognitive development. Typically, societies that provide formal schooling for children, implement it between ages five and seven. This is the time that many children begin school and develop the ability to cooperate and to coordinate points of view with others (Musen, 2010).

Phonemic awareness is essential for learning to read, but it is not enough in and of itself. Phonemic awareness must be incorporated in instruction and practice in order for
students to learn the relationship between letters and sounds (National Center to Improve the Tools of Educators, 1996). As students are taught the five components of reading, they build upon these skills to begin reading to learn. During this process, children learn to read fluently by regularly reading new stories and rereading older stories. Children are taught to extend their experiences with words, language, and ideas in books by progressively reading more difficult texts (National Center to Improve the Tools of Educators, 1996).

If trends hold true, 6.6 million low-income children currently in the birth to 8 age group are at increased risk of failing to graduate from high school on time because they will not be able to meet the proficient reading level of the NAEP by the end of third grade (Annie E. Casey Foundation, 2013a).

Reading proficiently by the end of third grade is a crucial marker in a child’s educational development. Failure to read proficiently is linked to higher rates of school dropout, which suppresses individual earning potential as well as the nation’s competitiveness and general productivity (Annie E. Casey Foundation, 2013a). By third grade, students are expected to know the fundamentals of reading and be able to apply their reading skills across the curriculum. Students are no longer being taught how to read in third grade. Instead, teachers use written text to teach other material such as social studies, science, and mathematics. Shifting from “learning to read” to “reading to learn” is very difficult for students who have not mastered basic reading skills. As they progress in age, struggling readers find themselves exposed to more and more complicated types of text. Simply stated, mastery of text gets more difficult for struggling readers. Of the fourth graders who took the NAEP reading test in 2009, 83% of children from low-income families and 85% of low-income students who attend high-poverty schools, failed to reach the “proficient” level in reading (Annie E. Casey Foundation, 2013a).
Reading skills in third grade are highly predictive of future academic performance. Fletcher and Lyon (1998) found that 74% of third graders who read poorly are still struggling in ninth grade. They also found that high school graduation rates can be predicted based on third-grade reading scores. Therefore, one can conclude that early reading skills affect not only graduation rates, but also economic impacts for students and communities.

While children in elementary school recognize reading as important, their success hinges upon their enjoyment of reading, motivation to read, and confidence in their own aptitude. Unfortunately, competence beliefs tend to decrease between first and fourth grade as children become more aware and compare themselves to their peers (Wigfield et al., 1997).

In a longitudinal study of literacy development in first through fourth grade, it was found that poor readers do not often read outside of school because they do not enjoy reading and would rather do other things (Wigfield et al., 1997). When asked whether they would rather clean their room or read, only 5% of the good readers said they would rather clean. In contrast, 40% of the poor readers preferred to clean. Therefore, children who are reading at grade level or who see themselves as skilled readers are more likely to spend their time reading, which reinforces and improves reading skills.

Furthermore, achievement, interest, and competence beliefs in reading are highly correlated to third grade student achievement. The students who enjoy reading the most and have confidence in their reading abilities are also the students who score the best on reading tests (Rathbun, West, & Husken, 2004). This suggests that struggling readers in early grades might avoid reading due to lack of engagement and lack of confidence. With less reading practice and lack of motivation, low-performing readers fall further behind their classmates each year, leading to lower graduation and college-going rates.
Typically, statewide standardized testing begins in third grade because it is challenging to accurately and thoroughly test younger children. Very young children have short attention spans and typically express their knowledge through interactive ways rather than through pencil and paper activities. Younger children develop cognitively in uneven and episodic ways, and are highly influenced by environmental factors (Guddemi & Case, 2004). Therefore, testing needs to be administered carefully, frequently, and in short amounts of time. Based on these findings, third grade is commonly the grade of choice to begin exposing students to the rigor and demand of statewide standardized testing.

The History of Reading Instruction

The debate over the best way to teach a student to read has been ongoing for over 100 years. For many years, effective reading instruction has led to many heated debates. As history shows, reading instruction had a bumpy road that reflected many of the concerns and policies of the time period. For example, during the colonial period, educators argued about materials and methods for teaching reading, including who should be taught in America’s schoolhouses (Monaghan, 2005). Young women were kept at home stitching and cooking while wishing for more schooling opportunities. Also, in the early 19th century, reading instruction became a “lightning rod” as the Quaker North Carolina-born abolitionist, Levi Coffin, was chastised for teaching enslaved people to read during Sunday school (Landau, 2006).

In the 1830s, the McGuffey Eclectic Reader was published and subsequently widely used in American schools. The book’s religious and moralistic content paralleled the patriotic enthusiasm for the new nation. While focusing on the alphabet and basic literacy, good citizenship was also inspired. The book was built as one text per grade level and included articulation guides for mispronounced words, introduction of vowel sounds, and much repetition.
(Dewitz, Leahy, Jones, & Sullivan, 2010). The McGuffey Eclectic Reader has been widely regarded as the predecessor of the modern-day basal. “Basal readers are collections of books in a series used for teaching reading” (About.com, 2014, “Definition,” para. 1). Despite the usefulness of the leveled text in one-room schoolhouses, Horace Mann, in his 1842 report to the Massachusetts Board of Education, expressed his disdain for the alphabetic-spelling approach (Graves, Juel, Graves, & Dewitz, 2011).

According to one teacher’s experiences in education, the teaching of reading has changed over the past 50 years. A former elementary teacher, who began her educational career in the fall of 1955, explained her experience as a teacher during a personal interview. Mrs. Bee taught first grade for one year and had approximately 57 students; however, the next year, she moved to second grade. During those early years, teachers stressed attendance. However, many of Mrs. Bee’s students were farm children and were often absent from school in order to work in the tobacco or cotton fields during certain times of the school year.

Although Mrs. Bee taught all subject areas, only reading books were provided. Since schools were segregated at the beginning of her teaching career, Mrs. Bee indicated the reading books were probably received from “white” schools that existed before integration. She taught Native American children until schools were integrated. During the first year of integration, she had one white student, seven black students, and the remaining children were Native American.

In her early years of teaching, a visitor to her classroom would see Mrs. Bee working with a group of students in a reading circle, using flash cards, flipcharts, and “Jerry and Alice” books. Later, “Dick and Jane” books were used during reading instruction. Words taught with flashcards and flipcharts were used in various classroom readings. Mrs. Bee remembered using the teacher’s manual, along with approximately 10 pre-primer books, which included different
levels of books for each grade level. She taught sentences such as the following during reading instruction: “See Jerry run”; “Run, Jerry, run”; and “Jerry can run fast.”

Mrs. Bee recalled moving from sight word reading instruction to phonics. Teaching how to read by focusing on phonics helped to better prepare students. Once they learned phonics, students were then ability grouped so they could become better readers.

When asked if subjects were integrated, Mrs. Bee did not recall the use of that term, nor did she recall an emphasis on helping students make connections to the real world. When teaching science or health, teachers were expected to teach in units that encouraged students to learn phrases and songs to go along with their lessons. For example, when teaching students about healthy eating habits, Mrs. Bee recalled singing the following: “M stands for milk. You need to drink plenty. No tea or coffee until you are 20.”

Teachers had to be creative. Copy machines were not available; therefore, teachers used a hectograph. Limited technology was available in the classroom to assist with instruction.

When asked about students who read below reading level, Mrs. Bee stated,

They may not have been the top readers, but they could read. Teachers had “slow” readers and may have retained some, but we did not have high numbers like today. Teachers may have gotten “the first reader” to help speed lower level reading up a little in second grade. Also, the teachers would let their top students, at a certain time of the day, work with students at a lower level. The top students became the teacher and listened to other child read. That was students helping students.

Beyond reading instruction, Mrs. Bee recalled administering some type of pretest and posttest. When asked where the tests came from, she stated that she guessed they came from the state. She recalled making a hand-made graph of student test scores from low to high. This information had to be submitted to the principal, but teachers did not do anything specifically with those scores.
The principal was the primary contact for curriculum and other educational issues. Later in her teaching career, Mrs. Bee remembered supervisors were hired to conduct classroom observations and make suggestions for improving instructional practices. Teachers were not evaluated based on their teaching performance during Mrs. Bee’s early years of teaching.

Professional development came later in Mrs. Bee’s educational career. She recalled attending music, language arts, science, and mathematics workshops outside the county. She remembered attending a workshop at Appalachian State University on team teaching, which she implemented for nine years. Team teaching included learning centers focused on creative writing, phonics, and listening for students to learn sounds. High-achieving first-grade students wanted to do what second-grade students were doing, and second-grade students wanted to do what third-grade students were doing. As a result, they worked well together and challenged one another. This type of teaching capitalized on the strengths and weaknesses of the students and teachers alike.

Mrs. Bee stated that she hopes that what is now being done in education is for the best. Her students got their foundation in a “country school.” She stated that she is proud when she sees these children, some of whom have now become doctors, lawyers, and professors. Most of all, she knows she played a vital part in their lives.

**Reading Instructional Trends**

**Introduction to Basal Instruction**

In the late 1880s, reading research began to shape curriculum development. Researchers in Germany discovered that it took less time to recognize a word than it did to recognize a series of unconnected letters (Dewitz et al., 2010). Instructional material publishers responded, and the alphabetic focus evolved into more of a word focus. In addition, research suggested that teachers
needed to be more structured and systematic when teaching reading. This led to the development of manuals offering extensive instructions to guide teachers in their interactions with pupils. In the early 1900s, early reading series used the word “progressive” in their title to indicate the fact that the series was leveled and suitable for readers as they progressed. Hence, the basal was officially born (Dewitz et al., 2010).

The basal text was developed to introduce readers to strictly controlled vocabularies with pictures serving as clues. While some basal reading programs began to include components for comprehension, such as reading questions and vocabulary exploration, the mode of instruction and the content continued to follow a more behaviorist approach which emphasized repetition and capturing correct responses (Dewitz et al., 2010).

The Elson Reader, later known as *Dick and Jane*, was published by Scott, Foresman, and Company in the early 1940s. In many ways, this series was the quintessential example of the basal series with its repetitive use of “Look” and “Run, Run, Run.” The repetitive use of small, simple words was aimed at building a child’s decoding ability. The upper elementary basal text had more complicated fiction passages and less repetition. The instructional mode was teacher-directed with the teacher preparing students to read individual passages. Students were instructed to read silently, and then answer follow-up questions that focused on decoding, skill building, and worksheets (Graves et al., 2011).

**The Phonics Approach**

Merriam Webster defined phonics as “a method of teaching people to read and pronounce words by learning the sounds of letters, letter groups, and syllables” (“Phonics,” 2013). Interestingly, an early phonics proponent, Rudolph Flesch, author of the 1955 *Why Johnny Can’t Read*, criticized the basal as lacking a sufficient explicit phonics emphasis. He advocated for a
return to a phonics approach (early teaching of early correspondences of letters and sounds; as cited in Chall, 1967). Keiser (2011) stated that this concern was addressed by Harvard Researcher, Jeanne Chall, in her 1967 book, *Learning to Read: The Great Debate*. Her findings suggested that a focus on phonics, rather than a whole word approach, could indeed lead to more student success. The whole word approach does not focus on word recognition, but making sense of texts (Tierney & Readence, 2005). The basal publishers listened to these researchers and responded by increasing their emphasis on phonics. This bottom up approach established decoding as a primary objective and was later given the term *phonics-based*. The bottom-up theory, described by Gough (1972), hypothesized that learning to read progresses from children learning parts of language, which are letters, to understanding whole texts (meaning; Reutzel & Cooter, 2005). As described by Marzano, with a bottom up approach, a reader begins with nothing, but keeps adding pieces until constructing a whole (Marzano & Paynter, 1994).

Now stressing phonics more than whole words, this bottom up approach became controversial in the 1970s in the context of the development of open classrooms and student-centered learning. The basal’s controlled vocabulary, artificial segmentation of words, and emphasis on white, middle-class families, was viewed as prescriptive and exclusive. In addition, a concern was raised about the abundance of practice sheets related to sub-skills lacking any clear alignment with the actual skills required of a strong reader. Critics of strictly phonics-based instruction also pointed to the reality that more than half of English words serve as an exception rather than an example of phonetic rules. Concern was also expressed about the over programmed and over scripted instructional model that the basal approach demanded from teachers (Graves et al., 2011). A call was issued for a more literature-based and *whole language* approach.
Whole Language

Early whole language advocate, Ken Goodman, wrote passionately about the need for a more constructivist, top down, and whole language approach to teaching reading which focused on individual students and their interests so that a teacher was tapping into a child’s innate motivation to learn to read rather than forcing memorization of word chunks and vowel sounds (Goodman, 2006). Goodman identified the role of the reader as making meaning from a text, not simply decoding a series of words or sounds. Ruddell (1992) provided a list of selected principles for language and literacy acquisition which served to define the whole language perspective and guide the development of the instructional methodology. Instead of offering a prescription for practice, educators focused on whole-language development for literacy learning environments based on the needs and experiences of students. Careful guidance is given to respond to each child’s needs (Tierney & Readence, 2005). This recognition is critical to the distinction between a phonics-based versus whole language curricular approach.

Advocates for a whole language view expressed concern that students needed access to authentic literature to spend time reading, not merely practicing reading’s subskills. The whole language approach embraced student choice, free reading time, and teachers reading aloud. Reed and Ward (1982) compared whole-language to a decoding emphasis. Dahl and Freppon (1995) and Dahl, Sharer, Grogan, and Lawson (1999) provided significant support for whole-language teaching versus more phonics-based teaching. The necessity of students reading only in books with carefully controlled, decodable vocabulary was disavowed.

Basal Bashing

The early 1980s witnessed an increase in basal bashing (Keiser, 2011). Publishers again changed course and began to include in basal texts more quality, multicultural literature
reflective of all American school children. There was a loosening of the strictly controlled, leveled vocabulary and an integration of writing and other language arts processes (Keiser, 2011).

Concurrently, the skills-based and mastery-learning approaches were growing in popularity and would exert an influence on the basal readiness series. Mastery learning stemmed from Benjamin Bloom in 1971. Basal reading publishers also helped develop mastery learning to align with their product (Fuchs, Fuchs, & Tindal, 1986). Bloom outlined a strategy, referred to as mastery learning, to describe an educational process in which students work with a certain instructional limit of learning in a process of assessing and correcting until objectives have been mastered (Guskey, 2010). Keiser (2011) indicated that the basal began to expand its reach into assessment materials by including numerous tools for assessing student progress. The criterion-referenced tests and worksheets assessing multiple reading skills could, in fact, assess more than 30 skills in one story unit (Dewitz et al., 2010). Criterion-referenced tests are tests tied to performance levels. Robert Glaser’s work in the 1960s led to an important movement in education as he initiated the idea of the criterion referenced tests to be used to measure the mastery of instructional objectives, describing what students know and can do (University Times, 2012). This thinking fueled the idea that if a student’s reading progress could be measured and documented, then perhaps it could be accelerated. The dilemma of balancing a teacher’s need to assess and a reader’s need to develop habits of a life-long reader can be appreciated in today’s milieu of high stakes accountability. An examination of the actual content of the basal series found that only 6% of the content in teacher manuals focused on teacher instruction to guide students in how to understand or comprehend the texts (Keiser, 2011). The
The majority of the manual, in fact, included directions and materials for the teacher to use while students read independently.

The move away from the basal series to a less structured, more student-centered reading environment was opposed for several reasons. Critics such as Sykes (1995) and Pressley (2006) were concerned by the apparent lack of structure and absence of a clear scope and sequence. They also questioned the underlying assumption that reading skills would naturally appear if students were exposed to rich, literate environments. The critics of the whole language approach voiced concerns that reading instruction was being left to chance.

**Reading Wars**

The Reading Wars (Lemann, 1997) pitted the phonics-based and whole language proponents against one another. On the one hand, research suggested that students at risk for reading failure benefited from explicit, systematic phonics instruction (Adams & Bruck, 1995). Also, advocates for phonics-based instruction claimed that the shift from systematic phonics-based instruction towards more constructivist whole language practices led to a decline in reading achievement (Sykes, 1995). On the other hand, the whole language camp suggested that reading achievement issues more likely stemmed from issues of poverty and a “drill and kill” mentality that caused student disengagement (Reyhner, 2008). Pressley (2006) concluded neither extreme is optimal for student learning. Therefore, balanced or integrated instructional approaches are more apt to improve overall reading achievement.

In 1985, the Commission on Reading published *Becoming a Nation of Readers*, a document that provided insight as to how students read and what best-practice and research-based reading instruction might look like. The report recommended the use of phonics, but with a caveat: for most students, phonics instruction should be reserved for the early primary years,
particularly before third grade (Scherer, 2004). Another recommendation was that students needed exposure to texts written in natural language and authentic material. The report also highlighted the need for less emphasis on worksheets and, finally, asserted the need for students to spend more time reading and for teachers to spend more time modeling the reading process.

In the past 30 years, approximately 40% of the nation’s fourth graders performed in the “below basic” category, while approximately 5% ranked in the “advanced” category or at the other end of the distribution (Reyhner, 2008). Despite this national study and apparent bridging of a divide, the feuding sides began to use data from national achievement rates to escalate the conflict. Each side pointed to the other as the reason for the decline in reading abilities for American children. Sadly, according to the National Assessment of Educational Progress, there has been little documented change in student fourth-grade reading achievement from 1992 to 2005. With this staggering achievement gap as a backdrop, a new way to teach reading needed to be forged. While both sides argued about which approach was better, an unacceptably large percentage of children continued to fail at reading (Wren, 2003).

As the reading wars debate continued, a new approach to reading instruction, balanced literacy, emerged. This approach relied on the premise that a beginning reader needs a balance of both phonics and enriched whole language instruction. A group of reading experts pointed to research suggesting that at-risk students needed exposure and opportunities both to build their comprehension and decoding skills (Cunningham & Shagoury, 2005). With balanced literacy, a solution was forming that might capitalize on the important aspects offered from both approaches and both sides of the debate.
A Balanced Literacy

The term “balanced literacy” can be found in numerous studies and papers. Spiegel (1998) defined balanced literacy as a decision-making approach through which the teacher makes thoughtful choices each day about the best way to help each child become a better reader and writer. A growing consensus suggested that balanced literacy may resolve the Reading Wars. A survey conducted by the National Institute of Child Health and Human Development found that 63% of elementary teachers believed that phonics should be taught directly and 89% believed that skills instruction should be combined with literature and language-rich activities (National Reading Panel, 2000). Spiegel (1998) asserted that avoiding instructional extremes is at the heart of providing a balanced program of reading instruction. He described balanced literacy as an instructional approach built on solid research, not public reaction or false promises. If balanced literacy is not a “silver bullet,” perhaps it is a “dove carrying an olive branch between the warring sides.” Regardless of the metaphor, it is important to understand how this approach works in a classroom for both the teacher and student.

The appearance and design of a balanced literacy approach may vary according to implementation, but there are several key components that must be present. It is a multi-layered instructional approach that includes the following:

• extensive authentic reading and writing,
• use of semantic and syntactic contextual cues,
• self-monitoring and self-regulation, and
• practice in reading with fluency, speed, and accuracy (International Reading Association [IRA], 2004).
The basic components of a balanced literacy approach include: read aloud and shared, independent, and guided reading (Pinnell & Fountas, 2006). The emphasis is on the student developing habits of a reader while teachers offer skills-based instruction that good readers are able to master. This includes the use of phonics knowledge and skills to decode and comprehension strategies to make meaning. In order for students to become proficient, life-long readers, they need the following instructional activities:

- time to read,
- access to books that match their reading ability and interest,
- time for experiences with making words,
- authentic exposure to phonemic awareness and phonics activities,
- encouragement to connect what they know from their lives to a text, and
- blocks of uninterrupted explicit instruction of comprehension strategies (Calkins, 2001).

Curricular models that allow teachers to maintain some autonomy in literature selection, methods, and materials were found to yield higher results in reading comprehension (P. Wilson, Martens, & Poonam, 2005). Capturing the impact of balanced literacy on students, Taylor, Pearson, Peterson, and Rodriguez (2005) studied the different teaching practices in urban, high-poverty classrooms. They determined that when teachers use active instruction that encouraged higher-order thinking skills as opposed to passive responding to literacy activities (as found in packaged curricula), students experience significant reading growth. However, it must be noted that balanced literacy is not without its critics. Strong phonics advocate Chester Finn suggests that whole language is now simply “wearing the fig leaf of balanced instruction” (Moats, 2007).
**Federal Influences Shape Reading Initiatives**

To prepare Americans for future jobs in a global market, education and training is paramount. Evidence from international studies suggested that students in the U.S. are trailing behind students in other developed countries, including Finland, China, Hong Kong, and Canada in the application of key subjects such as reading, mathematics, and science. Currently, the United States is ranked 17th in the world in reading, 23rd in science, and 31st in mathematics in Programme for International Student Assessment (PISA; Munson, 2011).

National studies frequently reported disturbing research about rising problems of illiteracy. Politicians, business leaders, community organizations, and parents are struggling to cope with its adverse and growing negative effects on society. Recently, the U.S. Department of Education issued a National Reading Report Card that showed 68% of our nation’s fourth graders are not able to read proficiently at grade level. At-risk youth, low-income children, and minorities lag even further behind and test at lower levels. The inability to read, write, and learn effectively does more than put disadvantaged children behind in school. Children with low literacy skills often feel self-conscious, are emotionally upset, and act out in ways that are harmful to themselves and others. In fact, a Department of Justice study found that 85% of all juvenile offenders have reading problems (NCES, 2008).

Federal, state, and local politics have played a very important role in the adoption of methods, philosophies, and trends concerning reading and literacy instruction. The National Educational Policy, first enacted over 200 years ago, instilled the concept that the control and operation of public schools were reserved to the individual states. Although this policy remains in force, the allocation of federal funding to the states has steadily set specific federally-mandated educational targets over the last 25 or 30 years (Cooper, Fusarelli, & Randall, 2008).
Since Sputnik, the initial “no-strings-attached” concept of federal funds dramatically changed to one of multiple strings. Federal involvement has targeted funding to improve educational opportunities for the disadvantaged, as well as for minorities, women, and the disabled. There have been dramatic increases in the regulation of federal funds in monitoring, reporting, auditing and compliance. During the last quarter-century, the focus of educational policy-making in America has shifted dramatically from the local level to state and federal governments.

The decision by the Supreme Court in the landmark case *Brown v. Board of Education* (1954) and the Great Society Social Reform programs of the 1960s are examples of how traditional roles in educational decision-making have been reformed. Wong (2008) does an excellent job explaining how the federal government’s role in education has shifted through the years. Today, it is viewed as one that oversees accountability in education and addresses the challenges of income inequities. Wong further explains that this has become necessary because many of the schools in the nation have over 60% of students eligible for the free and reduced school lunch program.

Schools having the highest concentrations of minority and low-income students are less likely to recruit qualified teachers, offer rigorous curricula, and maintain high academic performance. One can clearly see the presence of equality and accountability in the following federal programs, court cases, and policy initiatives:

- *Brown vs. Board of Education of Topeka* (1954)
- The Civil Rights Act of 1964
- The Individuals with Disabilities Education Act (IDEA)
- Title I, Part A of the Elementary and Secondary Education (ESEA) Act
• The No Child Left Behind (NCLB) Act of 2001
• Race To The Top (RttT) Funding

_Brown v. Board of Education_

In the 1950s, schools across the country began feeling the effects of laws and initiatives developed on the federal level to ensure equal education for all students. The most dramatic factor influence has come from the judicial branch, specifically the U.S. Supreme Court. The Supreme Court handed down the landmark decision _Brown v. Board of Education_ in 1954, declaring state laws that had established separate public schools based on race were unconstitutional. The Court has taken an activist role in education since the 1954 Brown decision, especially in the area of school desegregation and affirmative action (Dudley, 1994).

_Civil Rights Laws_

The anti-poverty and civil rights laws of the 1960s and 1970s dramatically increased the role of the federal government in public education. Laws passed included Title VI of the Civil Rights Acts of 1964, Title IX of the Education Amendments of 1972, and Section 504 of the Rehabilitation Act of 1973 prohibiting discrimination based on race, sex, and disability (Gilchrist, 2004). Not until 1969, with the passage of the Children with Specific Learning Disabilities Act (included in _Education of the Handicapped Act of 1970_, Public Law 91-230, Part G), did federal law mandate support services for students with learning disabilities. Even then, it took six years for Congress to pass the Education for All Handicapped Children Act (EHA) in 1975.

_A Nation at Risk_

Public education was ranked high on the national agenda when the U.S. entered the Cold War. In 1983, the publication _A Nation at Risk_ was a reminder that the nation’s longstanding
interest in academic achievement and education standards was being renewed. It was also a
reminder of the ever-growing federal role in public education to provide an equal educational
opportunity for all, as well as an interest in developing citizens capable of performing effectively
in a Global Economy (Good, 2010).

During the 1950s, when the Soviet Union launched Sputnik, this presented a perceived threat to the United States that created a major shift of nationwide school curriculum reform. This threat became the grounds for the National Defense Education Act of 1965, which focused on math and science education to bolster national defense (Gilchrist, 2004). In the 1980s, the nation experienced a change to education reform—the standards reform movement. The publication, *A Nation at Risk*, sparked many standards reform initiatives in a number of states. According to Clune (2001), the theory behind standards-based reform is as follows:

*Systemic reform* (SR), through its purposeful activities, leads to *Systemic policy* (SP), which leads to . . . rigorous implemented curriculum (SC) for all students, which leads to measured high student achievement (SA) in the curriculum as taught. (p. 2)

The assumption was that for the U.S. to stay economically competitive, it would have to adopt policy-level curriculum approaches similar to that of its international competitors. Furthermore, policymakers assumed that high stakes reform efforts would naturally lead to better classroom instruction and, therefore, better student performance (Riddle Buly & Valencia, 2002). Both states and local school districts initiated multiple systemic changes. Also, there was a shift to hold schools accountable for student learning (Clune, 2001). More recent attempts to hold schools accountable were seen in the reenactments of the Elementary and Secondary Education (ESEA) Act, which was first authorized in 1965 and the No Child Left Behind (NCLB) Act of 2001. Both federal legislative acts address setting national standards and mandating assessments to determine whether students are meeting those standards (Gilchrist, 2004).
IDEA

The Individuals with Disabilities Education (IDEA) Act is a federal law originally enacted in 1975 and reauthorized in 1990, 1997, and 2004. It is designed to protect the rights of students with disabilities by ensuring all students receive a free appropriate public education (FAPE), regardless of ability (U.S. Department of Education, 2013a). Furthermore, IDEA strives not only to grant equal access to students with disabilities, but also to provide additional special education services and procedural safeguards.

Title I

Title I, Part A of the Elementary and Secondary Education (ESEA) Act, is the largest federal education funding program for schools. It provides funding for high poverty schools to help students who are behind academically. The requirements of the No Child Left Behind Act include adequate yearly progress, highly qualified teacher standards, accountability, sanctions for schools designated for improvement, achievement standards and assessments, annual state report cards, professional development, and parent involvement (U.S. Department of Education, 2013b).

How do schools qualify to receive Title I funds? Schools qualify by demonstrating that enrollment consists of a high percentage of economically disadvantaged students. Title I regulations require school districts to provide services to all schools where at least 75% of students qualify for free or reduced price meals (U.S. Department of Education, 2013b).

Why are Title I funds allocated exclusively to high poverty schools? Research studies conducted over the past 30 years show conclusively that schools with high concentrations of economically disadvantaged students generally demonstrate lower levels of achievement than do schools with lower concentrations of economically disadvantaged students. As a result,
Congress, in the reauthorization of Title I under the No Child Left Behind Act of 2001, now requires districts to allocate Title I funds to those schools with the highest concentrations of such students, particularly those schools above 75% free/reduced lunch (U.S. Department of Education, 2013b).

Closing the Achievement Gap

The “achievement gap” is a matter of race and class. Across the U.S., a gap in academic achievement persists between minority and disadvantaged students and their White counterparts. This is one of the most pressing education-policy challenges that states currently face. . . For decades, policymakers, researchers, and school reformers have sought ways in which schools could address the gap. Strategies have focused on school funding, teacher quality, student interventions and motivation, school organization, management, and climate, market competition, and school accountability to the public. Between 1970 and 1988, the achievement gap between African American and White students was cut in half, and the gap separating Latinos and Whites declined by one-third. That progress came to a halt around 1988, however, and since that time, the gaps have widened. “Closing The Achievement Gap: Principles For Improving The Educational Success Of All Students” . . . developed by the ERIC Clearinghouse on Urban Education briefly reviews the educational policies and practices whose effectiveness in closing the achievement gap has been shown. (Muir, 2003, p. 1)

“Closing the Achievement Gap” now becomes as much an economic obligation as a moral one. As the nation becomes more diverse, the nation’s economic well-being and world ranking depends upon reaching students from underserved groups since minorities now account for half of all births in the United States. Traditionally, White and relatively affluent students from all ethnic groups have had opportunities for deeper learning and better exposure to 21st century learning. By contrast, instruction for students of color from low-income families has focused almost exclusively on basic skills and knowledge (Oakes, 1986). In other words, one group of students has been afforded the chance to engage in more meaningful learning experiences, while instruction for the other group tended to focus on lower level thinking skills, such as rote memorization tasks.
By 2050, the U.S. is expected to shift to a majority-minority country (Pollard & Mather, 2010). This simply means that more than half the population will be people of color or from ethnic minority groups. The U.S. economy will only continue to grow if the entire population, not just a portion, is equipped with the necessary literacy skills needed to thrive in the 21st century.

Keep in mind, the federal government reserves the right to restrict funding to state and local school systems that are not successfully meeting federal mandates and requirements. This clearly explains the panic and confusion experienced by school systems everywhere. Therefore, a need exists for schools to close achievement gaps, effectively utilize technology, and provide early academic intervention.

North Carolina continues its efforts to close the achievement gap and implement strategies aligned with 21st century skills. Dr. June Atkinson, NC State Superintendent, addressed this gap in North Carolina (see Appendix A).

Research studies have provided insight about the achievement gap. As problems continue to exist, North Carolina will analyze findings from previous and current studies to make future decisions about improving reading achievement. Current state policies and reforms have used major studies as a building block to help accomplish this goal. For example, a new policy, Read to Achieve (2013), was adopted in North Carolina and includes an assessment, mClass: Reading 3D, which addresses the components of reading provided by the National Reading Panel.

**The National Reading Panel**

In 1997, Congress formed the National Reading Panel (NRP) to conduct a meta-analysis of reading research to determine the most effective forms of reading instruction. The 2000
report, *Teaching Children to Read: An Evidence-based Assessment of the Scientific Research Literature on Reading and its Implications for Reading Instruction* was published and widely disseminated by the National Institute of Child Health and Human Development (NICHHD). In 2000, the NRP released their findings to conclude that the most effective reading instruction includes the following instructional practices:

- teaching children to break apart and manipulate sound in words,
- teaching that sounds are represented by letters of the alphabet which can be blended together to form words (phonics),
- having students practice reading aloud with guidance and feedback (guided oral reading), and
- applying comprehension strategies that guide and improve reading.

The NRP Report identified five major components for reading instruction including phonemic awareness, phonics, fluency, vocabulary, and comprehension. These were identified as essential components of reading instruction. The term scientific-based reading instruction (SBRI) was also established as well as scientifically-based reading research. The following excerpts are taken from the summary report of the National Reading Panel (2000). They provide a brief description of each of the five essential components of reading instruction and the evidence for their impact on learning to read: phonemic awareness, phonics, fluency, vocabulary, and text comprehension.

**Phonemic awareness.** The National Reading Panel (2000) stated that phonemes are the smallest units composing spoken language. For example, the words “go” and “she” each consists of two sounds or phonemes. Instruction in phonemic awareness involves teaching children to focus on and manipulate phonemes in spoken syllables and words. Overall, the
findings showed that teaching children to manipulate phonemes in words was highly effective under a variety of teaching conditions with a variety of learners across a range of grade and age levels. Teaching phonemic awareness to children significantly improves their reading more than instruction that lacks any attention to phonemic awareness (National Reading Panel, 2000).

**Phonics.** The same source also indicated the primary focus of phonics instruction is to help beginning readers understand how letters are linked to sounds (phonemes) to form letter-sound correspondences and spelling patterns and to help them learn how to apply this knowledge in their reading. The meta-analysis (2000) conducted by the National Reading Panel revealed that systematic phonics instruction produces significant benefits for students in kindergarten through sixth grade and for children having difficulty learning to read. The ability to read and spell words was enhanced in kindergartners who received systematic beginning phonics instruction. First graders who were taught phonics systematically were better able to decode and spell, and showed significant improvement in their ability to comprehend text. Older children receiving phonics instruction were better able to decode and spell words and to read text orally, but their comprehension of text was not significantly improved (National Reading Panel, 2000).

**Fluency.** Fluent readers are able to read orally with speed, accuracy, and proper expression. Fluency is one of several critical factors necessary for reading comprehension. The panel concluded that guided repeated oral reading procedures that included guidance from teachers, peers, or parents had a significant and positive impact on word recognition, fluency, and comprehension across a range of grade levels (National Reading Panel, 2000).

**Vocabulary.** There are two types of vocabulary—oral and print. A reader who encounters a strange word in print can decode the word to speech. If it is in the reader’s oral vocabulary, the reader will be able to understand it. If the word is not in the reader’s oral
vocabulary, the reader will have to determine the meaning by other means if possible. Consequently, the larger the reader’s vocabulary (either oral or print), the easier it is to make sense of the text (National Reading Panel, 2000).

The findings on vocabulary yielded several specific implications for teaching reading. First, vocabulary should be taught both directly and indirectly. Repetition and multiple exposures to vocabulary items are important. Learning in rich contexts, incidental learning, and use of computer technology all enhance the acquisition of vocabulary (National Reading Panel, 2000).

**Text comprehension.** The panel also stated comprehension is an active process that requires an intentional and thoughtful interaction between the reader and the text. Thus, readers derive meaning from text when they engage in intentional, problem solving thinking processes. The evidence suggested that teaching a combination of reading comprehension techniques is the most effective strategy. When students use them appropriately, they assist in recall, question answering, question generation, and summarization of texts. When used in combination, these techniques can improve results on standardized comprehension tests (National Reading Panel, 2000).

**No Child Left Behind (NCLB)**

In 1998, a significant report was issued entitled *Preventing Reading Difficulties in Young Children* (Snow et al., 1998). Following this report was the National Reading Panel Report (NRP, 2000) findings. These two historical initiatives led to passage of the No Child Left Behind Act (Israel & Duffy, 2009). The No Child Left Behind (NCLB) Act of 2001 is the most recent reauthorization of the Elementary and Secondary Education Act of 1965. This reauthorized law added strict new accountability changes and mandates that every child be
taught by a highly qualified teacher. The law emphasized new standards for teachers and new consequences for Title I schools that do not meet student achievement standards for two or more consecutive years. The law’s major goal is for every school to be at 100% proficiency by the 2013–14 school year as measured by state tests. NCLB required states to adopt academic standards for students (Learn NC, 2013).

The purpose of NCLB is to ensure that all children have a fair, equal, and significant opportunity to obtain a high-quality education and reach, at a minimum, proficiency on challenging state academic achievement standards and state academic assessments. This purpose can be accomplished fulfilling the following goals outlined by Sec. 1001 of the No Child Left Behind Act of 2001:

(1) ensuring that high-quality academic assessments, accountability systems, teacher preparation and training, curriculum, and instructional materials are aligned with challenging State academic standards so that students, teachers, parents, and administrators can measure progress against common expectations for student academic achievement;

(2) meeting the educational needs of low-achieving children in our Nation's highest-poverty schools, limited English proficient children, migratory children, children with disabilities, Indian children, neglected or delinquent children, and young children in need of reading assistance;

(3) closing the achievement gap between high- and low-performing children, especially the achievement gaps between minority and nonminority students, and between disadvantaged children and their more advantaged peers;

(4) holding schools, local educational agencies, and States accountable for improving the academic achievement of all students, and identifying and turning around low-performing schools that have failed to provide a high-quality education to their students, while providing alternatives to students in such schools to enable the students to receive a high-quality education;

(5) distributing and targeting resources sufficiently to make a difference to local educational agencies and schools where needs are greatest;

(6) improving and strengthening accountability, teaching, and learning by using State assessment systems designed to ensure that students are meeting challenging State
academic achievement and content standards and increasing achievement overall, but especially for the disadvantaged;

(7) providing greater decision making authority and flexibility to schools and teachers in exchange for greater responsibility for student performance;

(8) providing children an enriched and accelerated educational program, including the use of school-wide programs or additional services that increase the amount and quality of instructional time;

(9) promoting school-wide reform and ensuring the access of children to effective, scientifically based instructional strategies and challenging academic content;

(10) significantly elevating the quality of instruction by providing staff in participating schools with substantial opportunities for professional development;

(11) coordinating services under all parts of this title with each other, with other educational services, and, to the extent feasible, with other agencies providing services to youth, children, and families; and

(12) affording parents substantial and meaningful opportunities to participate in the education of their children. (U.S. Department of Education, n.d., para. 1)

With the reauthorization of No Child Left Behind, the work of the Common Core State Standards Initiative further raised expectations for what American children need to know and be able to do (Annie E. Casey Foundation, 2013a).

**National Assessment of Education Progress**

The NAEP, considered the “Nation’s Report Card,” serves as the measure of student achievement in the U.S. The performance of students can be compared across the nation or to other states (NCDPI, 2013c). Millions of children reach fourth grade without learning to read at a proficient level. Reading proficiency by the end of grade three is a crucial point in a child’s educational development (Annie E. Casey Foundation, 2013a). The first NAEP data collection was the 1969 trial assessment of the citizenship, science, and writing performance of 17-year-old in-school students in the spring of that year (NCES, 2013a). Considering the many changes and growth of NAEP over the years, the Elementary and Secondary Education Act Amendments of
1988 led to the authorization of an independent National Assessment Governing Board, signaling change in the governance of NAEP (NCES, 2013a). With No Child Left Behind, state testing programs were to be informally monitored by state NAEP results in mathematics and reading in grades 4 and 8. As the role of NAEP results has continued to increase in the educational field, the primary challenge has been to “keep up to date in assessment technology while maintaining an accurate record of student progress” (NCES, 2013a, “The National Assessment Governing Board Era,” para. 15).

Much discussion has arisen as to why so much variance exists in the percentage of students scoring proficient or above on state assessments across the country. Although this dissertation does not specifically focus on cut scores or performance descriptors, this section is included for readers to understand the concerns about these variations in NAEP scores.

Some research indicated the variations are due to the leniency or rigor of cut scores. A cut score is the minimum score required for performance at each NAEP achievement level. These minimum scores define the lower boundaries of basic, proficient, and advanced reading levels (NCES, 2013b). Cut scores are developed in a standard-setting process that depends heavily on the definition for each level of performance. Good performance level descriptors can serve as the foundation of an assessment program, driving everything from item development to cut scores and reporting (Perie, 2007).

Some researchers argued that the descriptors are instrumental to the validity and defensibility of the standard-setting process (Cizek & Bunch, 2007; Hambleton, 2001). Some research studies showed that reading cut scores appear very lenient in some states and stringent in others, particularly when compared to the reading cut scores on NAEP (Braun & Qian, 2007; McLaughlin, 2006; McLaughlin & Bandeira de Mello, 2005). Other researchers provided a
wealth of information on the importance of using performance descriptors to set cut scores (Berk, 1996; Impara, Giraud, & Plake, 2000; Livingston & Zieky, 1982). Perie (2007) argued that the best work on developing performance level descriptors was described by Loomis and Bourque (2001) in their work on NAEP achievement levels. Since each state sets its own standards and uses its own tests to measure proficiency, children in some states may be found to be proficient, but still lack the necessary skills needed to read at the minimal level required for fourth grade and beyond (Annie E. Casey Foundation, 2013a). Loomis and Bourque’s work led to the framework of developing performance level descriptors by specifying numbers and names of levels, drafting policy definitions, and then fleshing out the policy definition with full descriptors for each subject and grade level. As a result, NAEP served as a strong indicator of where students are performing across the nation.

Individual and school-wide scores are not provided in NAEP reports. Since 1990, scores have been available for state and national comparisons (McKenna & Stahl, 2003). These scores are reported in two different ways. First, the average scale score is reported for the states and the nation (McKenna & Stahl, 2003). Figure 1 showed North Carolina’s statewide average for Grade 4 reading. An analysis of these data indicated that students in Grade 4 have an overall average that is not significantly different from than the national average. The results from years 2002 and 2003 showed a state average that is higher than the national average.

Results are also reported by periodic benchmarks; NAEP’s governing board divided performance into three levels: basic, proficient, and advanced. These levels are translated into specific benchmarks for each grade (McKenna & Stahl, 2003). Figure 2 provided the NAEP performance level definitions and descriptions for the one way results are reported. Figure 3

<thead>
<tr>
<th>Achievement-Level Policy Definitions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Basic: Partial mastery of prerequisite knowledge and skills that is fundamental for proficient work at each grade.</td>
</tr>
<tr>
<td>Proficient: Solid academic performance for each grade assessed. Students reaching this level have demonstrated competency over challenging subject matter, including subject-matter knowledge, application of such knowledge to real-world situations, and analytical skills appropriate to the subject matter.</td>
</tr>
<tr>
<td>Advanced: Superior performance</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Fourth-Grade Descriptions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Basic: Fourth-grade students performing at the basic level should demonstrate an understanding of the overall meaning of what they read. When reading text appropriate for fourth graders, they should be able to make relatively obvious connections between text and their own experiences and extend the ideas in the text by making simple inferences.</td>
</tr>
<tr>
<td>Proficient: Fourth-grade students performing at the proficient level should be able to demonstrate an overall understanding of the text, providing inferential as well as literal information. When reading text appropriate to fourth grade, they should be able to extend the ideas in the text by making inferences, drawing conclusions, and making connections to their own experiences. The connection between the text and what the student infers should be clear.</td>
</tr>
<tr>
<td>Advanced: Fourth-grade student performing at the advanced level should be able to generalize about topics in the reading selection and demonstrate an awareness of how authors compose and use literary devices. When reading text appropriate to fourth grade, they should be able to judge text critically and, in general, to give thorough answers that indicate careful thought.</td>

a Accommodations not permitted. For information about NAEP accommodations, see http://nces.ed.gov/nationsreportcard/about/inclusion.aspx
showed the achievement-level percentages and average score results for North Carolina Grade 4 students.

As shown in Figure 3, the 2013 average score for fourth-grade students in North Carolina was 222, which is not significantly different from the national average of 221 for public school students. The following highlights additional NAEP data from the 2013 State Snapshot Report (U.S. Department of Education, 2014):

- The average score for students in North Carolina in 2013 (222) was not significantly different from their average score in 2011 (221) and was higher than their average score in 1992 (212).
- The score gap between higher performing students in North Carolina (those at the 75th percentile) and lower performing students (those at the 25th percentile) was 46 points in 2013. This performance gap was not significantly different from that in 1992 (50 points).
- The percentage of students in North Carolina who performed at or above the NAEP proficient level was 35 percent in 2013. This percentage was not significantly different from that in 2011 (34 percent) and was greater than that in 1992 (25 percent).
- The percentage of students in North Carolina who performed at or above the NAEP basic level was 69 percent in 2013. This percentage was not significantly different from that in 2011 (68 percent) and was greater than that in 1992 (56 percent). (“Overall Results,” paras. 2–5)

NAEP benchmarks were designed as high standards for children to accomplish (McKenna & Stahl, 2003). For example, if second-grade students performing on grade level experience three years of no growth during any of the next eight years, they will score three years behind on the college entrance Scholastic Aptitude Test (SAT). A year without reasonable growth puts the children at risk for academic failure (Fielding, Kerr, & Rosier, 2007).

Considering this information, North Carolina must understand the importance of the accountability model and the Read to Achieve Policy to ensure that every student can read at or above grade level by the end of third grade (NCDPI, 2012).
Race to the Top

The American Recovery and Reinvestment Act of 2009 (ARRA) provides $4.35 billion for the Race to the Top (RttT) Fund. This competitive grant program is designed to encourage and reward states that are creating the conditions for education innovation and reform; achieving significant improvement in student outcomes, including making substantial gains in student achievement, closing achievement gaps, improving high school graduation rates, and ensuring student preparation for success in college and careers; and implementing ambitious plans. North Carolina was a recipient of RttT funding.

Race to the Top (RttT) marks a historic moment in American education. The American Recovery and Reinvestment Act of 2009 offers bold incentives to states willing to spur systemic reform to improve teaching and learning in America’s schools. RttT has ushered in significant change in our education system, particularly in raising standards and aligning policies and structures to the goal of college and career readiness. RttT has helped drive states nationwide to pursue higher standards, improve teacher effectiveness, use data effectively in the classroom, and adopt new strategies to help struggling schools.

To date, President Obama’s RttT initiative has dedicated over $4 billion to 19 states that have created robust plans that address the four key areas of K-12 education reform as described below. These states serve 22 million students and employ 1.5 million teachers in 42,000 schools, representing 45% of all K-12 students and 42% of all low-income students nationwide. The Joint Education Appropriations Subcommittee (2013) outlines the four key areas of reform to include:

- Development of rigorous standards and better assessments
- Adoption of better data systems to provide schools, teachers, and parents, with information about student progress
- Support for teachers and school leaders to become more effective
- Increased emphasis and resources for the rigorous interventions needed to turn around the lowest-performing schools (Race to the Top, 2013, paras. 1–6).

The Race to the Top Fund Assessment Program provides funding to consortia of States to develop assessments that are valid, support and inform instruction, provide accurate information about what students know and can do, and measure student achievement against standards designed to ensure that all students gain the knowledge and skills needed to succeed in college and the workplace. These assessments are intended to play a critical role in educational systems; provide administrators, educators, parents, and students with the data and information needed to continuously improve teaching and learning; and help meet the President’s goal of restoring, by 2020, the nation's position as the world leader in college graduates. (U.S. Department of Education, 2010b, p. 18,171)
Forty-six states and the District of Columbia submitted comprehensive reform plans to compete in the Race to the Top competition. While 19 states have received funding so far, 34 states modified state education laws or policies to facilitate needed change, and 48 states worked together to create a voluntary set of rigorous college- and career-ready standards. (Race to the Top, 2013, para. 7)

Race to the Top rewarded states that have demonstrated success in raising student achievement and have the best plans to accelerate their reforms in the future. These states will provide the best reform ideas and models for others to replicate across the nation (U.S. Department of Education, 2009).

**North Carolina Education Initiatives and Policies**

A great public education system is one that prepares all students for postsecondary education, careers, citizenship and lifelong learning. It sets high standards and fosters the critical thinking and other skills needed in today’s global economy. A great state education system must evolve over time in response to changes in the state’s economic, technological, and social contexts as well as in response to development in other states and the world. (North Carolina State Board of Education [NCSBE], 2012b, p. 1)

North Carolina, a large and diverse southeastern state with 9.3 million people, has actively pursued reading policies throughout history. The vision for literacy in North Carolina is for all students to graduate from high school with the skills necessary for personal success and lifelong learning.

The implementation of mClass: Reading 3D was the result of policies and initiatives developed in North Carolina to meet federal and state educational reading mandates. For example, the North Carolina Budget Act of 2009–10, Section 7.18(b) stated that “. . . the State Board of Education shall investigate and pilot a developmentally appropriate diagnostic assessment for students in elementary grades during the 2009-10 school year” (General Assembly of North Carolina, 2009, p. 33). This assessment will enable teachers to do the following: (a) determine student learning needs and individualize instruction, and (b) ensure that
students are adequately prepared for the next level of coursework as set out by the *North Carolina Standard Course of Study*.

North Carolina State Board of Education (1999) policy required schools and school districts implement assessments at grades K, 1, and 2 that include documented, ongoing individualized assessments throughout the year and a summative evaluation at the end of each school year. These assessments monitor the achievement of benchmarks established in the *North Carolina Standard Course of Study*. The assessments may take the form of state-developed materials, adaptations, or unique assessments adopted by the local school board. The policy required grades K, 1, and 2 assessments to be implemented by all schools no later than the 2000–2001 school year. The intended purposes of these assessments were to (a) provide information about the progress of each student for instructional adaptations and early interventions, (b) provide next-year teachers with information about the status of each of their incoming students, (c) inform parents about the status of their children relative to grade-level standards at the end of the year, and (d) provide the school and school district information about the achievement status and progress of groups of students (e.g., by school and grade level) in grades K, 1, and 2. However, the policy has changed.

General Statute G.S. 115C-174.11(a) mandated that students in grades K-3 must be given a diagnostic reading assessment. Difficulty with reading development must be addressed with instructional supports and services. Local education agencies (LEAs) are encouraged to partner with community organizations and businesses to identify volunteers, mentors, and tutors to help enhance reading development and proficiency in students to improve their overall achievement. The law stated that “kindergarten, first, second, and third grade students shall be assessed with
valid, reliable, formative, and diagnostic reading assessments made available to local school administrative units by the State Board of Education pursuant to G.S. 115C-174.11(a).”

North Carolina was one of only 12 recipients of the 2010 federal RttT grants, which brought nearly $400 million to the state’s public school system for use over a four-year period (NCDPI, 2012). North Carolina used the RttT Grant to fund the implementation costs of mClass: Reading 3D because this assessment aligns with many requirements related to benchmark standards, assessments, and student achievement. The NCDPI mandated that school districts with the lowest achieving schools, as measured by reading proficiency, undergo a “school transformation” process and implement mClass: Reading 3D in grades K-3. In other words, implementation of mClass: Reading 3D became a requirement for many schools, not an option.

Career and College: Ready, Set, Go!

North Carolina’s Career and College: Ready, Set, Go! Initiative was designed to help the North Carolina State Board of Education reach its mission: “Every public school student will graduate from high school, globally competitive for work and postsecondary education and prepared for life in the 21st century” (p. 4). Tools and support have been provided for teachers and students to focus on learning to reach one goal: to graduate students who are career and college ready (North Carolina Public Schools, 2014). As part of the Ready, Set, Go! Initiative, Carolyn Guthrie, Public Schools of North Carolina Academic Services and Instructional Support Director for K-3 Literacy Program, informed North Carolina State Board of Education the mClass: Reading 3D assessment tool would meet the requirements of the Budget Act. The influence of federal laws and guidelines in North Carolina’s Career and College: Ready, Set, Go! Initiative was implemented in 2008 and encompassed four “pillars” of work:
Read to Achieve Policy

The latest North Carolina policy that has generated much attention to the need of getting students reading on grade level before the third grade has been the Read to Achieve policy. The Read to Achieve policy is part of the Excellent Public Schools Act, which became law in July 2012. This law is applicable to all schools at the beginning of the 2013–2014 school year (NCDPI, 2012). Seven components are addressed in the Read to Achieve program and are continuously being updated. As of April 2013, the following components were addressed: Comprehensive Reading Plan Process, Developmental Screening and Kindergarten Entry Assessment Process, Facilitating Early Grade Reading Proficiency Process, Elimination of Social Promotion Process, Successful Reading Development for Retained Students Process, Parent and Guardian Notification Requirements Process, and Accountability Measures Process. The mClass: Reading 3D assessment tool was chosen by the State of North Carolina to address the legislative component of facilitating early grade reading proficiency.

On August 2, 2013, the North Carolina State Board of Education adopted the State-Wide Implementation of Formative and Diagnostic Reading Assessments in Grades K–3. “Pursuant to the provisions of G.S. 115C-174.11 (a), the State Board of Education shall provide all local school districts a valid, reliable, formative and diagnostic reading assessment for kindergarten, first, second, and third grade, effective the 2013-2014 school year” (NCSBE, 2012a).

</tbody>
</table>
included information related to the policy described above, summarizing a breakdown of North Carolina’s Read to Achieve Facilitating Early Grade Reading Proficiency Process.

mClass: Reading 3D has been adopted as the state-wide formative, diagnostic assessment system to be used by all K–3 classroom teachers to assess students during benchmarking and progress monitoring in accordance with the State Board policy. Students are assessed to measure progress, diagnose difficulties, and inform instruction and remediation needs (NCDPI, 2012). Along with the beginning of year (BOY), middle of year (MOY), and end of year (EOY) assessments, progress monitoring assessments shall be given between each benchmark according to the state progress monitoring schedule. The policy included the teacher and administrators’ responsibility to analyze assessment data results and modify instructional practices to meet the individual needs of students. School administrators were given the responsibility to review a variety of data reports for the purpose of providing instructional leadership and professional development opportunities to ensure effective implementation of mClass: Reading 3D. District administrators were to review data to ensure fidelity of assessment implementation and identify trends to make necessary adjusts in instruction for maximum student results. To include collaboration with parents/guardians, schools were to provide families with program-generated written notification of their child’s progress.

**Wireless Generation**

Wireless Generation was founded in 2000 by Larry Berger and Greg Gunn, two Rhodes Scholars who shared a passion for technology and what it could do for educators. Wireless Generation was the first company to introduce classroom assessments for wireless devices to enhance K–12 learning (W. K. Kellogg Foundation, 2013).
Larry Berger was Founder and Executive Chairman of Wireless Generation. Berger led the invention of Wireless Generation’s mCLASS® system, which enabled educators to administer early reading and math formative assessments using handheld computers and then immediately receive results, analysis, and support for differentiated instruction. Today, Wireless Generation serves more than 3 million children and hosts one of the largest databases of longitudinal student data in the country (Wireless Generation, 2012a).

New instructional programs were created that allowed teachers to record assessment data electronically. Many districts and schools were looking to implement programs that will change student outcomes and the “teaching-learning” process. State and local school districts all across America were continuously looking for the perfect technology program that promised to do the following:

- Increase equity and access for students to help reduce the dropout rate and address the achievement gap
- Improve effectiveness and productivity of teachers and administrators and improve student achievement and outcomes

**Wireless Generation Changes to Amplify**

News Corporation (2013) credited Wireless Generation for being the pioneer that brought mobile assessments, along with instructional analytics to schools in America. News Corporation Chairman and CEO Rupert Murdoch states, “Wireless Generation is at the forefront of individualized, technology-based learning that is poised to revolutionize public education for a new generation of students” (as cited in News Corporation, 2010, p. 1).

Wireless Generation has now been changed to Amplify, an independent subsidiary of News Corporation. Amplify was founded in 2011, soon after News Corporation’s acquisition of
Wireless Generation. According to News Corporation (2013), Amplify is “reimagining the way teachers teach and students learn” (para. 1), enabling teachers to manage whole classrooms and, at the same time, empower them to offer more personalized instruction so that students become more active, engaged learners.

**History of DIBELS**

Dynamic Indicators of Basic Early Literacy Skills (DIBELS) is “an outcome-driven model, the purpose of which is to identify early, who may need additional support, evaluation and modified instruction in an ongoing formative basis to ensure that all children achieve high stakes reading goals” (Good, Gruba, & Kaminski, 2002, p. 700).

Beginning research and development of DIBELS was conducted in the late 1980s and early 1990s. The DIBELS program of research builds upon measurement procedures from Curriculum-Based Measurement (CBM; Deno, 1985; Deno & Fuchs, 1987), and General Outcome Measurement (GOM; Fuchs & Deno, 1991). The DIBELS measures were created to be economical and efficient indicators of a student’s progress toward achieving a literacy skill such as reading or phonemic awareness, and to be used for benchmark assessment and progress monitoring. Initial research on DIBELS focused on examining the technical adequacy of the measures for these primary purposes (Good & Kaminski, 1996; Kaminski & Good, 1996). The DIBELS measures were developed to serve as indicators of the essential early literacy skills a student must master to become a good reader. The five essential skill areas of early literacy outlined in the NRP (2000) report include:

- Phonemic Awareness
- Alphabetic Principle and Phonics
- Accurate and Fluent Reading
• Vocabulary
• Comprehension

Since initial publication in 2002, DIBELS has become known for its widespread use for monitoring progress in acquisition of early literacy skills (Dynamic Measurement Group, 2011). An extensive body of research has continued to document the reliability and validity of DIBELS as well as its sensitivity in measuring changes in student performance over time.

DIBELS measures are designed to quickly and efficiently assess reading and pre-reading skills in Kindergarten through sixth grade (Dynamic Measurement Group, 2013). These measures serve as indicators of the skill area designed to be assessed. The use of DIBELS helps teachers identify students who may need additional instruction to become good readers and can help the teacher monitor those students to ensure they make academic progress.

When using DIBELS, students should be tested three times per year, at the beginning, middle, and end of the year. Scores can be compared to empirically derived decision categories for a student’s grade level. Low risk performance from assessment results indicate that students have an 80% chance of achieving future proficiency. Some-risk performance indicates students have a 50% chance of achieving future proficiency. Those students falling into the at-risk performance category have an 80% chance of not achieving future proficiency (Goffreda, DiPerna, & Pedersen, 2009). With the results provided from DIBELS, teachers can determine which students are “on track” for learning to read and those who may need additional instruction and support to meet reading goals. With results from DIBELS assessment measures, teachers can monitor progress of all students. Instructional strengths and weaknesses are easier to identify when data are available on student performance. As noted from Good and Kaminski,
the original authors of DIBELS, DIBELS measures are not used to grade children or to make decisions about retention.

**DIBELS Next**

The DIBELS assessment provided outcome measures for screening and progress monitoring. DIBELS 6th edition has been replaced with DIBELS Next. According to Dynamic Measurement Group (2013), DIBELS Next included a series of research-based enhancements to increase the ease of use, reliability, and validity of the assessment (Dynamic Measurement Group, 2009). The 2000 NRP report and the 1998 National Research Council report outlined the essential early literacy domains. Assessing students on the basic early literacy skills, which are also known as foundational skills, can help distinguish students who are on track to become successful readers from students who are likely to struggle. Research showed that these skills are the basic building blocks that every child must master in order to become a proficient reader (Adams, 1990; NRP, 2000; National Research Council, 1998). Evidence also showed that these skills can be improved with instruction (Kame’enui, Carnine, Dixon, Simmons, & Coyne, 2002; Simmons & Kame’enui, 1998; Torgesen et al., 1999).

The Dynamic Indicators of Basic Early Literacy Skills Next (DIBELS Next) assessment is a set of brief, standardized, individually administered measures of early literacy designed to predict the literacy growth of children from Kindergarten through sixth grade. The six DIBELS Next measures reflected the essential early literacy domains described in the National Reading Panel (2000) and National Research Council (1998) reports. The measures addressed the key domains: phonological awareness, graphophonemic knowledge, word reading, oral reading accuracy, and comprehension of text (Wireless Generation, 2012c).
The DIBELS Next measures were developed to serve as indicators of the basic early literacy skills. An indicator is a brief, efficient index that provides a fair degree of certainty about a larger, more complex system or process (Dynamic Measurement Group, 2011). As indicators, DIBELS measures are not designed to be comprehensive, in-depth assessments of each and every component of a basic early literacy skill. The measures are designed to assess students on key components that are representative of that skill area, and are predictive of overall reading competence. Table 2 showed the alignment of DIBELS Next Measures with Basic Literacy Skills.

DIBELS Next is the current version of DIBELS, which replaced the previous version, DIBELS sixth edition. The new version has retained the best of DIBELS, but has been updated to increase ease of use and accuracy of results (Dynamic Measurement Group, 2012). DIBELS Next still used repeated indicators of foundational early literacy skills and can still be used for universal screening, benchmark assessment, and progress monitoring. “DIBELS Next represented a breakthrough revision, based on new research conducted over 4 years on over 25,000 students in 90 schools throughout the United States, as well as consumer feedback” (Dynamic Measurement Group, 2011, p. iv). Specific changes and benefits from DIBELS to DIBELS Next measures were shown in Table 3.

**DIBELS Research**

Advantages and disadvantages of the use of DIBELS are noted in research studies (Hoffman, Jenkins, & Dunlap, 2009). Advantages related to the speed of administration, identification of at-risk learners, and informing instruction. Disadvantages include the overemphasis on speed, administrative issues, and use of non-sense words. Other disadvantages

Modifications and Benefits from DIBELS to DIBELS Next Measures

<table>
<thead>
<tr>
<th>Measures</th>
<th>Modifications</th>
<th>Benefits</th>
</tr>
</thead>
</table>
| First Sound Fluency (FSF)         | First Sound Fluency replaces Initial Sound Fluency as a measure of early phonemic awareness | • No pictures, no guessing  
• Continuous timing  
• Increased reliability  
FSF is easier to administer and eliminates the issues with ISF that were caused by the pictures, students guessing at the answers, and the assessor starting and stopping the stopwatch for each item. |
| Phoneme Segmentation Fluency (PSF) | • New directions and layout to facilitate student understanding of the task and scoring  
• New arrangement of items (test words)  
• Checklist of common response patterns to facilitate linkages to instruction  
• No longer administered at the middle and end of first grade | • Increased ease of administering and scoring  
• Increased consistency of scores  
• Enhanced intervention planning |
| Letter Naming Fluency (LNF)       | • New font that may be more familiar to younger students  
• New directions and layout to facilitate student understanding of the task  
• New arrangement of items (letters)  
• Checklist of common response patterns to facilitate linkage to instruction | • More student-friendly  
• Increased ease of administering and scoring  
• Increased consistency of scores  
• Enhanced intervention planning |

documented included no comprehension test, like state-mandated tests and the limited amount of
information provided by DIBELS.

**mClass: Reading 3D**

mClass: Reading 3D is an observational reading assessment software for students in
grades K-5 (Amplify Education, 2014a). When using the software, assessors are able to obtain a
complete picture of each student’s ability to read with comprehension. The State of North
Carolina adopted mClass: Reading 3D to meet state mandates to ensure all students are able to
read by third grade (Read to Achieve, 2013).

The two assessment tools, DIBELS Next and Text Reading and Comprehension (TRC),
combine information to provide teachers with each student’s instructional reading level
(Collaborative Center for Literacy Development, 2013). The six DIBELS measures included
first sound fluency (FSF), letter naming fluency (LNF), phoneme segmentation fluency (PSF),
nonsense word fluency (NWF), DIBELS oral reading fluency (DORF), and Daze. The FSF
measure assesses a student’s ability to identify, isolate, and pronounce the first sound of an orally
presented word. LNF records the student’s ability to name uppercase and lowercase randomly
mixed letters. On the PSF measure, students identifies individual sounds that make up a word.
The NWF assesses the ability to decode and blend letters into words. The next measure, DORF,
measures the student’s ability to read connected text accurately and fluently. Using the Daze
measure, the student is presented with a reading passage in which some words are replaced by a
multiple choice box that included the original word and two distractors. The student reads the
passage silently and selects the word in each box that best fits the meaning of the sentence
(Amplify, 2011a).
The TRC measures text reading and comprehension with concepts about print, reading behaviors, oral comprehension, and written comprehension. Skills assessed include the ability to read connected text accurately, fluently, and with comprehension from authentic literature. This combination of assessments measures five important reading skills all children must develop to become proficient readers:

- hearing and using sounds in spoken words (phonemic awareness),
- knowing the sounds of letters and sounding out written words (alphabetic principle),
- reading words in stories easily, quickly, and correctly,
- reading with comprehension, the ultimate goal of reading, and
- understanding and using a variety of words and learning new words.

Teachers gather this reading skill data about their students by administering the DIBELS and TRC assessments. They then enter the information into mClass Reading: 3D software via Net Books, Palm Pilots, or IPADS. The software disaggregates the data, provides individualized assessment information about each student’s reading progress, and tracks the student’s progress during the school year. This 21st century assessment tool is designed to efficiently determine students’ reading progress quickly by providing immediate feedback from the mClass: Reading 3D software. This allows classroom instruction to help meet student needs in a timely manner.

**Nuts and Bolts of mClass: Reading 3D**

Understanding the mClass: Reading 3D components is important to this study as findings will indicate how the tools may or may not be used. Using mCLASS: “Now What? Tools,” educators extend the functionality of the program in practical ways to translate class and student reports into individualized instruction for each student. The mCLASS: Item-Level Advisor tool extends reading assessment functionality by automatically highlighting important patterns, which
provides a detailed analysis, and suggesting the next steps to be taken for targeted instruction. The mCLASS: Small Group Advisor is another option under the “Now What? Tools.” This component “uses results from the reading assessments to help teachers create optimal groups of students with similar needs and select targeted instructional activities at the appropriate level of challenge and intensity” (Wireless Generation, 2013b, para. 3). Students are sorted into one of nine intervention groups according to mCLASS: DIBELS Next and TRC Benchmark assessment results. Measure 1 determines the horizontal placement: well below benchmark and far below proficient students at the left of the group block. Students at or above benchmark and proficient/above proficient students are at the right. Measure 2 determines the vertical placement of the student. Well below benchmark and far below proficient students are on the top, whereas at or above benchmark, and proficient/above proficient students are on the bottom. If the educator feels students should be grouped in another way, new sets of groups can be created. Students who fall into a category alone may be grouped with others, using the “tidy” option.

The mCLASS: Home Connect component allows educators to provide parents with progress reports and specific instructional activities to help improve student learning at home. The report visually outlines assessment levels on specific skills and provides an explanation of progress.

The Reporting and Analysis Suite helps educators keep track of saved reports in one specific place. A variety of reports are accessible to review data and navigate between mCLASS: DIBELS and TRC. Icons are visible in the reports section of the program for a common visual language. When viewing the “Comparing Population Report,” educators may view the history of academic development and use color codes to visualize and understand performance. Educators are able to drill down to detailed information to improve student
reading achievement. Areas of strength and concern can be identified through reports to help make informed decisions concerning student performance. When using the “Correlation Effectiveness Report,” educators have the ability to cross-reference and analyze data points. Measures can be correlated for a period of time to see how instruction in one area may impact outcomes in another (Wireless Generation, 2013a).

Feedback provided through the assessment tools are compared to research-based benchmark proficiency cut points to provide educators with an indication of students’ reading skills and predict literacy outcomes. With immediate feedback, educators have the opportunity to make effective, informed instructional decisions to improve student reading achievement.

The mobile device is used during assessment to gather and store detailed student responses. Once assessments are completed, the educator has the ability to sync the handheld device. Data are stored and is accessible through the mCLASS website through Amplify. The educator logs into the data system to gain access to a variety of reports with student data.

The data stored is available for educators to monitor students for risk on the foundational literacy skills of phonological awareness and phonics with adaptive, deeper diagnostics available for students at a higher risk (Wireless Generation, n.d.). Educators are able to screen and progress monitor students.

Along with progress monitoring, the software assessment tool provides historical profiles and various reports of each student and classroom through the website. This enables educators to track student progress from year to year and class to class.

Last of all, Amplify provides embedded professional development to expand educators’ knowledge with a deeper understanding of the reading process. As the educators spend more
time observing how students use cues to make meaning from texts, they are able to differentiate instruction to improve students’ reading skills.

**Why mClass: Reading 3D?**

The mClass: Reading 3D program was developed through a unique partnership with the authors of Dynamic Indicators of Basic Literacy Skills (DIBELS), Montgomery County Public Schools, University of Chicago Center for Urban School Development (USI) in collaboration with Chicago Public School teachers, and Wireless Generation. (Wireless Generation, 2010, as cited in Collaborative Center for Literacy Development, 2013, p. 1)

Results from mClass: Reading 3D are compared to research-based benchmarks to immediately provide individualized instructional activities in the classroom. The detailed reporting and analysis from the software includes features that use book sets from Rigby, Mondo Publishing, and the University of Chicago (STEP). More than 5,800 leveled readers from over 20 different publishers are used for progress monitoring. The administration of the assessments, along with progress monitoring, helps teachers determine the strengths and weaknesses of skills accessed and inform instruction. Teachers are also more likely to identify the types of errors each student makes and adjust instruction using tools from the software such as mClass: Now What? Tools. The small-group advisor, which uses student DIBELS Next scores, will assist the teacher in creating groups for targeted intervention. Additionally, the item-level advisor offers observations explaining patterns of significance in the student’s skill development (Amplify Education, Inc., 2013b).

Preliminary studies of mClass: Reading 3D solutions showed 50% of time savings in assessment administration, which gives teachers three to five instructional days back per year (Wireless Generation, n.d.). As teachers are provided formative feedback on student assessments, they are able to differentiate instruction in efforts to have a greater impact on student achievement. The use of DIBELS Next, combined with reading records, provides a
balance to measure student reading skills. Based on over 30 years of research, reading records are derived from the theory that by understanding the types of errors made by a student, educators can better diagnose the specific skills needed to improve student achievement.

On June 2, 2010, the National Governors Association Center for Best Practices (NGA) and the Council of Chief State School Officers released the K-12 Common Core Standards. Wireless Generation and Amplify aligned mClass: Reading 3D components to the Common Core English Language Arts Standards for Grades K-5, specifically pertaining to Reading Standards for Literature K-5, Reading Standards for Informational Text K-5, and Reading Standards: Foundational Skills. The alignment with K-3 Common Core ELA standards is shown in Appendix B. As students continue to be assessed with mClass: Reading 3D software in efforts to improve student reading achievement, the focus of assessment using technology will continue to be reviewed to ensure the process is aligned with 21st century technology.

**Technology and Student Assessment**

A strong and dramatic change has been sweeping through our schools. Students are using cell phones to answer questions and survey each other. Kindergarten students are using the iPad to read stories and complete number lines to explain the process to the teacher. High school students are communicating across many countries and learning hybrid style. Professor Sherwood Thompson from Eastern Kentucky University summarized hybrid teaching as a process designed to incorporate the best techniques and advantages of face-to-face and digital technology. This instructional module discussed strategies for teaching with online course materials, blogs, twitter, texting, iPod, podcasting, digital textbooks, and computer PowerPoint presentations (Thompson, 2009). These students are not the same 21st century students who used computers to play games, watch videos, and simply search the web. These new 21st
century learners are highly relational and demand quick access to new knowledge. More than that, they are capable of engaging in learning at a whole new level. With the world literally at their fingertips, today's students need teachers and administrators to re-envision the role of technology in the classroom (Blair, 2012).

In the 2010 National Education Technology Plan, Secretary of Education Arne Duncan clearly stated, “The challenge for our education system is to leverage the learning sciences and modern technology to create engaging, relevant, and personalized learning experiences for all learners that mirror students’ daily lives and the reality of their futures” (INACOL, 2008). As educators know, teaching is a complicated practice that requires an interweaving of many kinds of specialized knowledge. In this way, teaching is an example of an ill-structured discipline, requiring teachers to apply complex knowledge structures across different cases and contexts (Mishra et al., 2012; Spiro & Jehng, 1990). Teachers practice their craft in highly complex, dynamic classroom contexts (Leinhardt & Greeno, 1986) that require them constantly to shift and evolve their understanding. Thus, effective teaching depends on flexible access to rich, well-organized and integrated knowledge from different domains (Glaser, 1984), including knowledge of student thinking and learning, knowledge of subject matter, and increasingly, knowledge of technology.

At the heart of good teaching with technology are three core components: content, pedagogy, and technology, plus the relationships among and between them. The interactions between and among the three components, playing out differently across diverse contexts, account for the wide variations seen in the extent and quality of educational technology integration (Koehler & Mishra, 2009; Koehler, Mishra, & Yahya, 2007).
It is time to shift mindsets away from the notion that technology provides a supplemental teaching tool and assume, as with other professions, that technology is essential to successful performance outcomes (i.e., student learning; Arnold, 1998; Ertmer & Ottenbreit-Leftwich, 2010). To put it simply, effective teaching requires effective technology use. Recent research resulting from both large- and small-scale efforts (Bauer & Kenton, 2005) suggested that we have yet not achieved high levels of effective technology use, either in the U.S. or internationally (Kozma, 2003). Furthermore, if and when technology is used, it typically is not used to support the kinds of instruction (e.g., student-centered) believed to be most powerful for facilitating student learning (Cuban, Kirkpatrick, & Peck, 2001). The computer is no longer “the new kid in school.” Since the early 1980s, when computers were first used in schools, more than $3 billion has been spent on hardware, software, teacher training, and connections (Fulton, 1997).

Technology and Early Literacy Assessment

It is no secret that children learn differently. Some need visual experiences. Others respond to auditory cues. Still others need hands-on familiarity. Some need all three. The same is true when children learn to read. Technology gives teachers exciting new ways to accommodate individual differences among students while motivating them to accomplish the difficult cognitive work involved in becoming phonemically aware and literate. Using appropriate technologies, children can see, hear, and feel the concepts of reading and writing spring to life. Children are highly motivated as they learn to manipulate letters and words in an interactive, multisensory environment.

The use of technology can be an effective support tool in differentiating reading instruction by (a) presenting information and activities to students, (b) assessing students’ work, and (c) being a scaffold or support to reading successfully (Leu, 2000). In 2000, the National
Reading Panel issued a report on effective, research-based reading instruction. The panel concluded that “effective reading instruction implements phonemic awareness, phonics, fluency, vocabulary and text comprehension” (Leu, 2000). Teachers who are knowledgeable and effective cannot be replaced with technology. However, technology can be used to support students struggling in the above mentioned areas (Leu, 2000). Technology allows students to see, hear, and do. It also supports the teacher with resources to meet those needs in a timely and effective manner. To achieve the kinds of technology uses required for 21st-century teaching and learning (Lai, 2008; Law, 2008), we need to help teachers understand how to use technology to facilitate meaningful learning, defined as that which enables students to construct deep and connected knowledge, which can be applied to real situations. Although “technology can make it quicker or easier to teach the same things in routine ways,” it also makes it possible to “adopt new and arguably better approaches to instruction and/or change the content or context of learning, instruction, and assessment” (Lawless & Pellegrino, 2007, p. 581). mClass: Reading 3D uses technology to assess, and teachers are able to adapt instruction based on the needs of the students.

Technology tools can provide an easy, efficient way to help teachers facilitate and customize learning for each student. Using sight, touch, and sound, teachers can directly address diverse learning styles and ability levels, provide unlimited opportunities for practice, and make learning to read fun and engaging.

Technology should be viewed as a way to assist the learning process by providing an easier way to collect and analyze reading assessment data. Research is providing valuable information on the implementation and application of a technology-based reading assessment program, mClass: Reading 3D, offered through Amplify. Literacy expectations, too, have
advanced from the basic paper and pencil assignments to publishing with technology (Clay, 2001b). The AACTE Committee (2008) commented, “Literacy will constantly be redefined as new technologies emerge and as expectations change for what it means to be literate” (p. 63). Herrington, Hodgson, and Moran (2009) predicted that “by 2011, it would be hard to argue for the validity of an assessment in writing that did not provide for digital composing” (p. vii).

**Technology and Formative Assessment**

In 1913, Thomas Edison predicted in the *New York Dramatic Mirror* that “books will soon be obsolete in the schools . . . It is possible to teach every branch of human knowledge with the motion picture. Our school system will be completely changed in ten years” (as cited in Sadler, 1989, p. 98). Throughout the 1920s and 1930s, the availability of radio broadcasting and movies with sound launched audiovisual instruction movement (Reiser, 2001). In 1926, the Scholastic Aptitude Test (SAT) was first administered. In the 1950s and 1960s the revolution was to be led by television and film, and since the 1970s, it was to be computers (Chambers, 2005). In fact, televisions and computers are now commonplace in education at all levels (NCES, 2002). Although technological applications began in the early 20th century, educational technology research and theory did not begin until the 1960s (Ross, Sullivan, & Tennyson, 1992).

Technology has led to vast improvements in formative assessments. Formative assessment (Assessment for Learning) is the most important type of assessment done in the classroom. Formative assessment is an active and intentional learning process that includes the teacher and the student continuously and systematically gathering evidence of learning with the ultimate goal of improving student achievement (Moss & Brookhart, 2009). The process of helping students moves forward from their present learning state to their expected learning goal.
Thomas R. Guskey suggested that for assessments to become an integral part of the instructional process, teachers need to change their approach in three important ways. They must “1) use assessments as sources of information for both students and teachers, 2) follow assessments with high-quality corrective instruction, and 3) give students second chances to demonstrate success” (Guskey, 2007, p. 107). Assessments in schools are a necessity. Assessing students’ learning takes time and in some cases creates anxiety for both teachers and students.

In the past, Jonassen, Howland, Marra, and Crismond (2008) found computer-based testing was used to simplify the testing process for teachers and administrator and to enable, through scan sheets and tests actually completed by students on a computer, a faster turnaround on scoring students’ work. Computer-based tests can have meaningful applications in learning. Teachers are challenged to ensure that students meet a myriad of required national, state, and local standards. Students must develop skills necessary for success on any and all assessments. According to C. Wang and Algozzine (2008), “Formative assessments play an important role in both the traditional learning environment and the e-Learning environment” (p. 1,249).

Traditionally, this has been a paper-pencil type of data collection. However, Amplify offers a way to collect this data electronically, which speeds up the delivery of that data analysis for each child. For this study, formative assessment, also called progress monitoring, is defined as “a probe used between benchmarks to target specific content areas for remediation” (Reaves & O’Sullivan, 2010, p. 38).

**Technology and Implementation**

Some researchers agreed that educators should not assume that just because a program is adopted, it would be implemented as intended (Desimone, 2002; Klein & Sorra, 1996; Mills & Ragan, 2000). Educators adopt programs and without further research, assume that it will yield
positive results. Klein and Sorra (1996) echoed, “implementation is the critical gateway between the decision to adopt the innovation and the routine use of the innovation within an organization” (p. 1,057). In order to yield expected results, implementers must ensure that the program has been implemented with fidelity.

Fidelity of implementation is described as the comparison between the programs as intended with its actual use (Mills & Ragan, 2000). Patton (2002) believed, “it is important to know the extent to which a program is effective after it is fully implemented, but to answer that question it is important to learn the extent to which the program was actually implemented” (p. 161). Most often, studying the implementation of educational programs offers valuable information regarding the influence of programs. In a program, “the implementation part is where the real action occurs” (Grammatikopoulos, Tsigilis, & Koustelios, 2007, p. 107). Monitoring these programs after implementation can also provide valuable information about the targeted population, program activities, and the overall validity and success of the program.

Teachers and administrators often implement programs and are disappointed with the results, assuming the program was flawed. In many cases, once a review is complete they realize it may simply be the implementation process that was flawed. Pressman and Wildavsky (1984) believed that “implementation and evaluation are the opposite sides of the same coin, implementation providing the experience that evaluation interrogates and evaluation providing the intelligence to make sense out of what is happening” (p. xv). Organizations often find that the reason for inability to achieve results is dependent upon implementation of the program rather than the innovation of the program (Klein & Sorra, 1996). There are three possible established benchmarks that reflect implementation of a program: partial, moderate, and full (Desimone, 2002).
Some studies use benchmarks to set targets for successful implementation; however, some implementation studies established their own empirical benchmarks (Berends, 2000). Desimone (2002) believed that an effective implementation was not always a defined standard. However, he went on to share that researchers have given full implementation a meaningful definition. These established benchmarks give researchers more details about whether the program was implemented with fidelity or with failure.

Relevant, personalized, collaborative, and connected learning experiences enhance student engagement, which in turn drives student achievement. Although these learning experiences were available in a more limited way before the advent of technology, digital conversion has taken them to an entirely new level (Allington & Gabriel, 2012).

Real-time data from benchmarks give teachers precise information to provide personalized interventions, to extend help to individual students, and to assign students to work in flexible collaborative groups—groups that can change as students progress at different rates or redirect their learning focus. Several researchers have found that the digital environment allows a collective of students and talents to come together, with an enhanced impact on learning. Thomas and Brown (2011), in *A New Culture of Learning*, state that learning communities, facilitated by technology, allow students—both individuals and groups—to deepen and broaden their conceptual understanding of curriculum topics and also provide valuable information about the targeted population, program activities, and the overall validity and success of the program (Allington & Gabriel, 2012).

After reviewing research relating to technology and literacy assessments, several common themes emerged: immediate feedback to students, progress monitoring, cost effectiveness, and changes in education.
Revolutionized Education

Using technology in early literacy assessments could revolutionize education. Wang (2008) shared that with technology, there is no real time or space constraint. It allows for spontaneity and opportunities for students to learn. T. H. Wang (2008) stated that virtual performance based assessments allow for more triangulation of student accomplishment. It increases engagement and allows for more authentic inquiry. MacDonald (2007) believed that mobile technology allows for better documentation of observations. He also discussed how technology helps students to better meet learning objectives. Researchers agreed that use of technology in assessments help students.

The Impact of Professional Development

“We Learn . . .
10% of what we read
20% of what we hear
30% of what we see
50% of what we see and hear
70% of what we discuss
80% of what we experience
95% of what we teach others.”
- William Glasser, MD

Few policymakers dispute that high-quality professional development is a central component in nearly every modern proposal for improving education. Therefore, it is no surprise that a vast amount of funds from the federal, state, and local level are devoted to professional development each year (Putnam & Borko, 2000). Clearly, schools can be no better than the teachers and administrators who work within them. A common purpose of professional development is to alter the professional practices, beliefs, and understanding of school persons toward an articulated end (Griffin, 1983). In most cases, that end is the improvement of student learning (Laczko-Kerr & Berliner, 2002; Snow et al., 1998). Researchers have previously agreed
that teacher quality and expertise consistently and accurately predict student achievement (professional development has been a part of teaching since the early days of formal education). It has evolved throughout time; nevertheless, debates over content and implementation of teacher education programs have been waged for years within conclusive results.

A World Cat search conducted on January 4, 2010 revealed a pattern. From the onset of formal public education through the 1970s, teacher training was generally referred to by the public as “teacher education” or “in-service.” By the 1980s, with education under closer scrutiny, it became “staff development.” In the 1990s, a push to “professionalize” teaching careers gave birth to the term “professional development.”

Guskey (2000) defined professional development as those processes and activities designed to enhance the professional knowledge, skills, and attitudes of educators so that they might, in turn, improve the learning of students.

In his book, Evaluating Professional Development, Guskey (2000) stated that in order for professional development to be effective, the following characteristics must be present:

• It must be an intentional process. In other words, it is consciously designed to be purposeful to bring about positive change and improvement. Random goals and unrelated activities cannot exist.

• It must be an ongoing process. Educators on all levels must be continuous learners. This requires constant analyzing of the effectiveness of what they do. Educators must be willing to make adaptations when necessary and explore new alternatives and practices for the sake of student achievement.

It is a systematic process. Guskey explained that when professional development is viewed systemically, it is not seen just in terms of individual improvement, but also in terms of
improvements in the capacity of the organization to solve problems and renew itself. Past experiences have taught educators that fragmented, piecemeal approaches do not work for professional development. One-shot workshops based on the most current educational fad also do not work due to the lack of guidance and support.

The purpose of professional educational development programs is to create effective teachers. High-quality professional development is a central component in nearly every modern proposal for improving education. Some researchers argued that it is the quality of professional development offered to teachers that affects teacher knowledge, beliefs and practices, and student achievement (Anders, Hoffman, & Duffy, 2000; Duffy, 2004; Richardson, 1996). Wiggins (1989) contended the truest assessments must always help learners—whether they are students or teachers—and they must always include something purposeful. He further claimed such tests should provide forward movement, not just reflectivity of prior learning. His assertion sustains what educators have been saying for decades—professional development needs to lead them toward becoming better instructors, not just fill their heads with new information. Teachers attending professional development programs are, in essence, the students—the learners—attending with the sole intent of becoming the best teachers they can for their own students. For this reason, it is critical for presenters of professional development sessions to exemplify excellent teaching strategies and serve as role models for attending teachers. Teachers know best what they need in the classroom. The more they are involved in the planning and implementing stage of professional development, the more effective it will be.

New views on professional development have led to new models and designs. Sparks and Loucks-Horsley (1989) described the seven major models that present educators with a wide variety of options and opportunities to enhance skills and knowledge. They included the
following: (a) training, (b) observation/assessment, (c) involvement in a development/improvement process, (d) study groups, (e) inquiry/action research, (f) individually guided activities, and (g) mentoring. Policy-makers increasingly recognize that schools can be no better than the teachers and administrators who work within them. While these proposed professional development programs vary widely in their content and format, most share a common purpose: to alter the professional practices, beliefs, and understanding of school persons toward an articulated end (Griffin, 1983).

**Professional Development Reform**

Effective professional development is a necessary component in all educational improvement efforts. Every proposal to reform, restructure, or transform education emphasizes the role of the classroom teacher as the main conduit in efforts to bring about needed change. To meet the goals of reform, including standards, assessments, and accountability, teachers must make changes that involve much more than learning new teaching techniques. The changes form the core of what it means to teach and learn.

The history of American education is filled with numerous attempts at reform. The National Commission on Excellence in Education presented a report to the public titled *A Nation at Risk* in April of 1983. This report documented the needs of the public education system. The opening paragraphs of this document stated:

Our nation is at risk. Our once unchallenging preeminence in commerce, industry, science, and technological innovation is being overtaken by competitors throughout the world. This report is concerned with only one of the many causes and dimensions of the problem, but it is the one that under girds American prosperity, security, and civility. We report to the American people that while we can take justifiable pride in what our schools and colleges have historically accomplished and contributed to the United States and the well-being of its people, the educational foundations of our society are presently being eroded by a rising tide of mediocrity that threatens our very future as a Nation and as a people. What was unimaginable a generation ago has begun to occur—others are
matching and surpassing our educational attainments. (U.S. Department of Education, 1983, p. 5)

The most recent federal legislation promoting standards-based educational reform of our nation’s schools was signed into law in January 2001 by President George W. Bush. This initiative, NCLB, was designed to ensure that “all children have a fair, equal, and significant opportunity to obtain a high quality education and reach, at a minimum, proficiency on challenging state academic achievement standards and state academic assessments” (No Child Left Behind, Sec. 1001, 2002). No Child Left Behind is a law of good intentions. It demands that every child meets state standards with 100% proficiency by the 2013–2014 school year and created more rigorous standards in reading, math and science. The policy requires districts to employ highly qualified teachers and to provide professional development based on proven educational methods and strategies.

**Leadership in Professional Development**

Administrators, as educational leaders, have a responsibility to provide the best professional development they can for their teachers. Of all the duties the administration team is required to perform, providing instructional leadership is by far the most important (Newman, 1992). They must never lose sight of the fact that everything done in schools is supposed to benefit students. Making teachers effective instructors and training them to develop strong, lifelong learners, is of utmost importance (Trehearn, 2010).

One of the most effective ways for administrators to lead is to promote lifelong learning to their teachers. Administrators, who encourage educators to look at their instructional practice and really analyze it, provide teachers with vital information to improve. School principals have the great responsibility and privilege of helping teachers learn. The administrator’s job is to act as a liaison between teachers and professional development coordinators. Administrators must
ensure that presenters will dignify and empower teachers. They need to give teachers a chance to tell them what they need. When teachers understand how a program is meaningful, resistance is usually diminished. Paul Mack, former Associate Director of the Regional Professional Development Center in St. Louis, Missouri said, “I’ve seen the most stressed out educators take on something new because it had meaning for them, when it tapped into the energy and calling that brought them into schools to begin with” (as cited in Senge et al., 2000, p. 383).

Administrators must be experts on collaborative learning and know how to promote it among their professional members. By recognizing that staff members need materials that support their learning and work in the classroom, administrators have the opportunity to create a culture of adult learning (National Association of Elementary School Principals [NAESP], 2001). Carroll (2009) believed in order for quality teaching to occur, administrators must provide “a collaborative culture that empowers teachers to team up to improve student learning beyond what any of them can achieve alone” (p. 8). According to Showers (1985), teachers who receive support generally practice new strategies more frequently. Follow up should be connected into classroom instruction (Fullan, 1995). Blasé and Blasé (2001) noted that administrator support will enhance teacher motivation, self-esteem, sense of security, and morale.

**Professional Development Models**

Professional development models provide a variety of opportunities to enhance professional skills (Guskey, 2000). Guskey determined that training is the most efficient and cost-effective professional development model for sharing ideas and information with large groups of educators. The best training sessions outline clear objectives and participant outcomes. Exploration of theory, demonstrations or modeling of skills, simulated practice,
feedback about performance, and coaching in the workplace (Joyce & Showers, 1983) should be evident in effective training sessions.

**Professional Learning Communities**

During the last 20 years, researchers have promoted the professional learning community (PLC) model as an organizational framework for school reform. This model has been gaining momentum as an increasing number of organizations and schools have gained success with this model (Schmoker, 2004). The idea of learning organization was brought to the forefront in the business world by Senge’s (1990) work *The Fifth Discipline*. He believed that the five dimensions of systems: thinking, personal mastery, mental models, shared vision, and team learning can build organizations that “truly ‘learn’ and can continually enhance their capacity to realize their highest aspirations” (Senge, 1990, p. 6). As business leaders and researchers investigated the potential of the learning organization model to support organizations in a rapidly changing environment, the educational community began to forge its definition of the professional learning community.

In *The Fifth Discipline*, Peter Senge (1990) stated,

shared vision is not an idea. . . . It is, rather, a force in people’s hearts, a force of impressive power. It may be inspired by an idea, but once it goes further—if it is compelling enough to acquire the support of more than one person—then it is no longer an abstraction. It is palpable. People begin to see it as if it exists. Few, if any, forces in human affairs are as powerful as shared vision. (p. 206)

DuFour, Eaker, and Dufour (2005) defined professional learning communities as environments created by educators that foster mutual cooperation, emotional support, and personal growth as they work together to achieve what they cannot accomplish alone. The cornerstone of an effective PLC is the unwavering focus on improving student learning and the commitment of teachers to work collectively toward achieving this outcome. DuFour (2004) outlined the main actions of a successful PLC:
1. commit and contribute to collaborative teams;
2. clarify purpose and priorities of learning;
3. gather continual data on student achievement;
4. identify areas of concern and generate interventions;
5. create common, formative assessments;
6. assess the impact of the identified interventions; and
7. support each other through this process.

DuFour (2004) and DuFour et al. (2005) further explained that when educators remain persistent and focused on improving the achievement for ALL students, the likelihood of sustained and substantive success is increased.

PLCs require school staff to focus on learning rather than teaching. In *Getting Started: Reculturing Schools to Become Professional Learning Communities*, Eaker, DuFour, and Dufour (2002) identified characteristics of a professional learning community. Schools described had collaborative teams, demonstrated collective inquiry, had an action orientation and willingness to experiment, desired continuous improvement, were results-oriented, and exhibited a shared mission, vision, and values. DuFour et al. (2005) suggested that teams collaborate on matters related to learning and hold each other accountable for the kind of results needed to sustain continual improvement. Their collective commitments will help all students raise their levels of achievement. Schools that do not display the discipline to initiate and sustain this work will not become more effective. Schools can close the achievement gap right now by using what they already know about instruction and by what they choose to do within learning communities. The benefits for students and for educational professionals will be immeasurable. DuFour (2004) stated the importance of this work best with the quote, “The rise and fall of the professional
learning community depends not on the merits of the concept itself, but on the most important element in the improvement of any school—the commitment and persistence of the educators within it” (p. 11).

**Observation/Assessment**

The observation/assessment model of professional development is one of the best ways to learn. It allows for analyzing and reflecting on information as a means of professional growth. Peer coaching and clinical supervision are examples of the observation/assessment model. Showers and Joyce (1983) explained that the major advantage of this model is that it provides important benefits to both the observer and the one being observed. However, care must be taken to separate the observation/assessment process from evaluation issues. Coordination of time and schedules must take place to accommodate both the observer and the one being observed.

**Involvement in Development/Improvement Process**

This model brings educators together to develop or review a curriculum, design a new program, plan strategies to improve instruction, or solve a particular problem (Guskey, 2000). Processes such as these generally require participants to read, research, discuss, and observe to acquire new knowledge and skills. When teachers, administrators, noncertified staff, parents, community, and others get together to collaborate, more appreciation and awareness develops for individual differences and perspectives. On the contrary, some settings may allow for argued opinions to take precedence over research and best practices. Involvement must not be restricted to a relatively small portion of staff members.
Study Groups

Effective study groups are those that are well organized, focused, and have sufficient time to accomplish their tasks. This model usually involves the entire staff of a school in finding solutions to common problems. Murphy (1997) states the major functions of study groups are to facilitate implementation of curricular and instructional innovations, collaboratively plan school improvement efforts, and study research on teaching and learning. Members can be divided into groups of four or six. Groups usually select a different aspect of a specific problem on which to concentrate. By involving all staff members, a breakdown of “isolation” felt by many educators will frequently occur. Study groups reinforce the idea of schools as learning communities for students and educators alike (Guskey, 2000).

Inquiry/Action Research

The inquiry/action research model of professional development helps educators become more reflective practitioners, more systematic problem solvers, and more thoughtful decision makers (Guskey & Sparks, 1996). This model helps to narrow the gap between research and practice. Here, educators are required to (a) select a problem or questions of a common interest; (b) collect, organize, and interpret information related to the problem; (c) study the relevant professional literature and research; (d) determine possible actions that are likely to achieve commonly valued goals; and (e) take action and document results (Calhoun, 1994). The inquiry/action research model is based on the belief that educators have the ability to create valid questions about their own practice and pursue answers to those questions. Depending on the complexity of the problem, this process may require a substantial amount of time and commitment.
Individually Guided Activities

In the individually guided activities model, educators determine their own individual development goals and then select the activities that they believe will result in the achievement of those goals (Guskey, 2000). The model is based on the assumption that individuals can best judge their own learning needs and are capable of self-direction. Major advantages are afforded to participants using the individually guided activities model. For example, educators are allowed a generous amount of flexibility, choice, and individualization. Excellent opportunities are provided for self-analysis, personal reflection, and thoughtful decision making (Guskey, 2000). The model assumes that individuals are more likely to learn when they are given the opportunity to be a part of the initiating and planning process.

Mentoring

“The mentoring model of professional development typically involves pairing an experienced and highly successful educator with a less experienced colleague” (Guskey, 2000, p. 28). Mentoring allows for highly individualized professional development that benefits all individuals involved. Opportunities are provided for on-the-job observations, in-depth discussions for improvement and goals, the sharing of ideas and strategies, and the reflection on current methods. Mentors need to have great credibility and the ability to initiate curriculum and school change. Mentors need to be highly competent and respected by peers and students. The mentoring process can form lifelong, highly productive professional relationships (Drago-Severson, 1997). As with the other models, there are disadvantages associated with this model. For example, unless paired with other forms of professional development, mentoring may limit opportunities for a broader range of collaboration and collegial sharing.
Five Critical Levels of Professional Development Evaluation

Never has the importance of quality professional development been of greater importance than today. Educational reforms and plans everywhere are constantly emphasizing the need for high quality education. Guskey (2000) identified four reasons for the growing interest in professional development. The first is that educators have a better understanding of the dynamic nature of professional development. No longer can professional development be seen as “something done to educators” for three or four days during the school year. There is a focus in measuring progress in better and more meaningful ways. Therefore, professional development cannot be excluded from evaluation and measurement of knowledge, skills, and student achievement.

A second reason for the growing interest in evaluation is the fact that professional development is recognized as an intentional process to bring about change—but not just for the sake of change (Guskey, 2000). Educators recognize that if their efforts are to be counted as successful, relevant information related to the goals must be gathered, analyzed, and meaningfully presented. Hence, the impact, as well as the effectiveness of professional development received by educators cannot be overlooked or minimized.

A third and equally important reason for the emphasis on the evaluation of professional development is the need for better information to guide reforms in professional development specifically and educational programs generally (Guskey, 2000). Current evidence indicates that false claims of success are the basis of many school reform strategies. This is due to the lack of better and timelier evaluations of new practices and programs as well as their implementation. Potential users need to know about the effects, conditions of success, costs, and unanticipated problems and concerns.
Lastly, a fourth reason for the growing interest in program evaluation is the increased pressure at all levels of education for greater accountability (Guskey, 2000). No longer can teachers and school administrators continue to do things just because “we’ve always done it this way.” Educators at all levels are coming to realize that they must be able to offer clear and understandable evidence to all interested parties to show that professional development makes a difference. As in other professions such as medicine and engineering, improved understanding of the processes and procedures that lead to success allow the artistry, judgment, and reflection to become more valid and effective in reaching our ideals (Gagne, 1997).

Meaningful and effective evaluations of professional development, however, require more detail. Guskey (2000) presented a five-level evaluation model designed to resolve inadequacies and address a broad range of “what” and “why” questions. The model included these five critical levels of professional development evaluation:

1. Participants’ Reaction—This level analyzes the participants’ reactions to the experience. The questions address whether or not participants liked the professional development.

2. Participants’ Learning—This level focuses on measuring the knowledge, skills, and perhaps attitudes that participants gained. A common question may be, “Can participants describe the critical attributes of mastery learning and give examples of how these might be applied in common classroom situations?”

3. Organization Support and Change—In this level, the focus shifts to the organization and to information on organization support and change. They also can hinder or prevent success, even when the individual aspects of professional development are
done right (Sparks, 1996). Organizational policies that are incompatible with implementation efforts can interfere with implementation efforts.

4. Participants’ Use of New Knowledge and Skills—This level focuses on whether participants are using their new knowledge and skills on the job. A central question is, “What did participants learn to make a difference in their professional practice?” In other words, how can you tell if what participants learned is being used and being used well?

5. Student Learning Outcomes—This is typically referred to as “the bottom line” in education at Level 5. What was the impact on students? Did the professional development program benefit students in any way? Measures of student learning typically include indicators of student performance and achievement. A variety of measures of student learning is important at level 5 (Joyce, 1993). Evidence can be gathered from assessment results, portfolio evaluations, grades, study habits, school attendance, homework completion rates, and classroom behaviors, among others.

**mClass: Reading 3D Professional Development**

Professional Development is at the center of all education reform strategies. Without it, such strategies are merely good ideas that cannot find expression. More districts today are recognizing that they cannot improve student achievement without well-designed staff development initiatives.

During the 2009–2010 school year, the North Carolina Department of Public Instruction piloted reading diagnostic assessment systems across all regions in the state. Professional development played an important part in the implementation process. There were 27 schools involved in the reading pilots (NCDPI, 2010a). The reading assessment piloted was mClass:
Reading 3D from Wireless Generation. Schools were trained in the late fall, and teachers began benchmarking students with the Middle of Year (MOY) assessments. Teachers formatively assessed students throughout the spring of the year and used the assessment results to guide their instruction in the classroom. End of Year (EOY) assessments were given in early May (NCDPI, 2010a).

During the 2010–2011 school year, 235 more schools were trained to assess students utilizing mClass: Reading 3D. The number of schools participating in the implementation of mClass: Reading 3D has consistently grown each year. As of June 2013, all elementary schools in the district chosen for the study were utilizing mClass: Reading 3D for formative and summative student assessments and to make daily decisions concerning instruction.

North Carolina’s goal was to begin, continue, and upgrade the assessment system in one-fourth of the elementary schools starting with the 2009-2010 school year. During professional development sessions, the following goals were displayed:

- Developmentally appropriate diagnostic assessment in elementary grades.
- Determine student learning needs and individualize instruction.
- Ensure that students are adequately prepared for the next level of coursework.
- Use technology to assess students and record information.
- Facilitate more frequent formative assessment for struggling students.
- Provide interventions for students in a timely manner.
- Bottom line—Students must get meaning from reading. This will bring success on the EOG.

The state covered the cost of licenses, kits, training, substitutes, and technology for schools without devices (Amplify Education, 2010). The North Carolina Department of Public
Instruction worked directly with Wireless Generation to procure all services. Professional development was to be ongoing. Also, there was to be ongoing support from the North Carolina Department of Public Instruction, North Carolina Technology Association (NCTA), and Wireless Generation. Train the Trainer models were conducted first. Every participating school sent a designated person to be trained to ensure every school would have a “go to” person for advice, troubleshooting, implementation issues, and other concerns related to mClass: Reading 3D. Tech training also took place prior to the implementation of the product at the school level to ensure proper installation and enrollment of devices. After devices were properly installed at the school level, teachers began training sessions with their colleagues at their respective schools using a turnkey training model (Amplify Education, 2010). In training, a turnkey is an employee who has been sent off campus to learn a specific skill. The turnkey is expected to return and share what they have learned with other employees. The turnkey becomes a trainer who turns the keys (of knowledge) over to someone else.

To help further improve the process and bring about understanding and support from such an initiative, the University of North Carolina at Chapel Hill conducted an evaluation of the schools undergoing the implementation process in 2009–2010 (NCDPI, 2010a). Data were collected from surveys, consulting visits, focus groups, and diagnostic system reports. The purpose of the study was to evaluate the use of Personal Digital Assistants (PDAs) in the classroom as assessment tools to guide instruction through formative assessment. PDAs were distributed to teachers who received training in how to use the PDAs in November 2009 and were then encouraged to practice with the technology in December 2009. These teachers were asked to use the PDAs in lieu of paper and pencil assessments they had been using to collect literacy information on their students. Specifically, did they use DIBELS assessment
information as well as *Text and Reading Comprehension* (TRC) information? Training sessions were coordinated by the North Carolina Department of Public Instruction and conducted by Wireless Generation. Training sessions familiarized trainees with the use of the PDA, how to encode and decode data, how to conduct assessments, and how to use that data to guide instruction. Training helped teachers develop confidence using the PDAs and allowed them to practice with trainers using actual student level data. Following the training, teachers were asked to use the PDAs to assess students throughout the remainder of the school year, which allowed teachers access to results immediately following assessments. Teachers then were asked to use these data to monitor students based on risk levels calculated by the PDA and to adjust instruction to meet students’ needs (NCDPI, 2010a).

The evaluation had both outcome and process components. The outcome evaluation involved assessing the extent to which the project objectives were accomplished, which focused on improvement in teachers’ assessment practices using the PDAs. The process evaluation entailed gathering information from project stakeholders to improve project operations. Data from Wireless Generation surveys, summaries from focus groups conducted by staff, and observations were used to compile the information for project operation improvement. A connection to Guskey’s theories and ideas associated with professional development and evaluation is shown using focus groups.

The following questions were developed in collaboration with North Carolina Department of Public Instruction staff responsible for the project and were used to guide the external evaluation process; questions with asterisks (*) were identified by the North Carolina State Board of Education (2010a):
A. Outcome Evaluation:

1. * Will the use of technology increase the fidelity of the assessment?
2. * Will teachers use the information and data to guide their daily instruction?
3. How widely and regularly was the assessment administered?
4. Were teachers highly qualified to administer the assessment?
5. How comfortable were the assessors with assessing and using assessment results?
6. * Is formative assessment/progress monitoring being used and how?
7. * How do teachers use the data generated from the assessments?

B. Process Evaluation

1. What support do teachers need to implement an assessment system using PDAs?

A portion of Guskey’s theories and ideas associated with professional development and evaluation was practiced in the study described above using focus groups.

Technology is one area that cannot continue to be overlooked, in conjunction with both budgetary issues and the pure necessity of incorporating it into educational opportunities. Many teachers admit to being uncomfortable with using instructional technology as a method of teaching. They do, however, concede that with proper training, they would be interested in implementing it into their classrooms (Davis, Preston, & Sahin, 2009). Careful planning, prioritizing, inclusion of teachers as presenters, professional learning teams, research-based decision making, use of local experts, termination of costly district teacher assemblies, collaboration with and visitation to other local schools, and shared reading—especially with low-cost Internet sources—are not only viable, but potentially valuable options for providing effective, inexpensive professional development for teachers (Hirsh, 2009). Schools want to get a good product for the money they spend. Involving teachers in professional development
presentations is one of the most certain ways to achieve this. By empowering teachers and capitalizing on their professional specialties, money spent on professional development is minimized while results are maximized.

**Professional Development Summary**

The push to provide exemplary teachers for every student in every school across the nation is an ongoing goal—and concern—among parents, the educational community, and lawmakers. In order to achieve success in this mission, professional development provided to educators must be of the highest possible standard. Professional development must be transformed through rigorous inspection, dissection, and reconfiguration with the intent of making it the vital agent it should be to enhance teachers’ effectiveness. Teachers can execute change when they are provided the tools for them to do so. Money, planning time, and control issues must be considered by administrators when professional development is conducted. This will assist educators in truly becoming master teachers.

If the purpose of school is to truly ensure high levels of learning for all students, professional development must first clarify what each student is expected to learn. The primary purpose of professional development (PD), also known as staff development, is to empower educators to approach their responsibilities from a different standpoint, and/or utilize new strategies. Hayes Mizell, the first distinguished senior fellow of the National Staff Development Council and former director of the Program for Student Achievement at the Edna McConnell Clark Foundation states, “It is not a matter of getting more money or days for professional development, though both would be helpful. Rather, the change required is to make professional development responsive to the objective learning needs of teachers and their students” (Mizell, 2010, p. 23). Bray-Clark and Bates’s (2003) analysis of ways to improve teacher effectiveness
states, “The bottom line is that teachers want and need practical in-service activities that address their genuine needs in the classroom, make them better teachers, and that improve student outcomes” (p. 14). Bray-Clark and Bates (2003) go on to say, “We believe that using teacher self-efficacy as an organizing concept around which teacher in-service training can be designed and evaluated presents a viable and promising means for advancing toward this end” (p. 14).

Professional development should be embedded in a school’s practices including time built in for teachers to work together to discuss pedagogy, analyze data, plan lessons, and share best practices. Guskey (2000) warned that a successful change effort is not an event that is removed from the teachers’ day-to-day responsibilities, but instead is a part of their daily activities that are both natural as well as recurring.

With a national focus on quality instruction as exhibited by federal legislation such as PL 107-110, also known as No Child Left Behind Act (NCLB), the spotlight has been placed upon schools to adequately hire, train, and maintain highly qualified teachers. The literature on effective approaches to professional development suggested that they are ongoing, job-embedded, focused on collaboration, and have commitments to dependent learning environments, along with inquiry and reflection (Darling-Hammond & McLaughlin, 1995; Hord, 1997; Senge, 1990). In addition, effective professional development has a structured, collaborative culture with a focus on learning (Eaker, DuFour, & Burnette, 2002), where stakeholders are engaged in an ongoing commitment to continuous improvement (DuFour, 2012) and where content knowledge and practice are shared among participants (Darling-Hammond & McLaughlin, 1995; Eaker, Dufour& Dufour, 2002; Hord, 1997). Effective professional development induces educators to improve their instructional practices (Mizell, 2010).
**Program Evaluation**

In the early development of evaluation, Scriven (1967) defined evaluation as judging the worth or merit of something. Fitzpatrick, Sanders, and Worthen (2011) concurred that evaluation is defined as determining the worth or merit of an evaluation object. Scriven (2007) discussed the importance of evaluation in pragmatic ethical, social and business, and intellectual terms. He developed a Key Evaluation Checklist to use as a guide for evaluating program evaluation. The checklist was intended to be used in designing and evaluating programs, plans, and policies; writing evaluation reports on them; assessing their evaluability; and assessing evaluations (Scriven, 2007). Throughout the checklist, Scriven addressed values that may be relevant to an evaluation.

The current study made use of a program evaluation research design to collect data that would facilitate decision-making and to make determinations regarding the extent the implementation of mClass: Reading 3D has on students’ reading achievement among second-grade students, the extent data has been used to modify instruction, and the extent mClass: Reading 3D professional development has impacted student reading achievement.

The data collection and analysis from this study may help the selected school district evaluate the impact and implementation of mClass: Reading 3D on reading achievement for students in second grade. Results provided evidence of how teachers have used student data to determine instructional practices to impact student achievement. A detailed analysis revealed the extent to which continuous and ongoing professional development associated with mClass: Reading 3D provided teachers with the necessary skills to impact students’ reading achievement. This study sought to help determine the role mClass: Reading 3D should play in the future as it pertains to reading development in the K–3 classrooms. The results can also help the district
assess the time, money, and effort they have designated for the mClass: Reading 3D program. The results added to the body of research related to the topic. It also contributed to the research in literacy and technology as the state and district move forward in 21st century learning and globalization. Results are relative to universities as the education department prepares perspective teachers for future roles in education.

**Summary**

A decrease in reading scores at the federal, state, and local level have increased the need to improve student academic reading achievement (NCDPI, 2013d). As a result, federal, district, and school mandates have placed a sense of urgency on improving students’ reading abilities. The adoption of mClass: Reading 3D has been the result of a “perfect storm” type situation that has been brewing in the field of education after a period of status quo. Here education experienced a turbulent meeting of the following punctuations:

- Strenuous policies and mandates from all levels
- The influence of technology in a changing society
- Poor student rankings and results from international and national testing
- Higher teacher accountability and standards
- The need to improve reading assessments

These events have led North Carolina to search for a program that provided early intervention and diagnostics of reading skills, and improved test scores. Much attention, time, and energy has been placed on mClass: Reading 3D to form successful partnerships with the hundreds of schools across the state.

Amidst all the chaos associated with the many directions and educational shifts taking place in America’s classrooms, educators needed reassurance that mClass: Reading 3D will
bring about some hope for the literacy problems existing in our country today. Educators wondered about the quality of mClass: Reading 3D reading diagnostics and assessments in K–3 classrooms. One does not dispute the potential of technology to assess students and generate information to improve validity and reliability in the results. However, research was needed to determine mClass: Reading 3D program effectiveness as it relates to student reading achievement and cost.

A small number of surveys and research has been conducted that showed teachers have a favorable perception of the program (North Carolina General Assembly, 2010). Data shown in the North Carolina General Assembly report (2010) indicated teachers have been complimentary of the training and support they have received and continue to receive with mClass: Reading 3D thus far. However, we are only beginning to scratch the surface with the amount of research that needed to be generated. Research remained limited on the implementation practices of mClass: Reading 3D as well as program strengths and weaknesses. Research needed to be conducted to show whether mClass: Reading 3D was sufficiently helping students to read on grade level by third grade. Equally as important, research was needed that showed a positive correlation to mClass: Reading 3D scores and EOG scores.

Valid and reliable assessment is essential in determining how districts are succeeding with early reading intervention. Assessments are needed to help students and teachers understand their own strengths and weaknesses. Identifying and addressing students’ academic challenges early will save students years of struggle and isolation. Early reading proficiency scores can identify which students are right for early intervention programs, rather than relying on teacher referral alone.
Snow et al. (1998) found that when children’s reading problems are diagnosed and addressed early, their reading achievement improves. They also addressed the importance of literacy for students to be successful in a global and competitive society.

The extensive review of literature in this chapter has addressed the reading instructional trends over the 20th century and the beginning of the 21st century. The educational and political battle has continued to address concerns from what materials and methods should be used to teach reading to whether a phonics based approach or whole language approach to teach reading is better. While some researchers such as Chall (1967) and Flesch (1955) emphasized the importance of being able to sound out (read) words based on how they are spelled, others such as Goodman (2006), Dahl and Freppon (1995) and Dahl et al. (1999) pushed the whole language approach in which the reader gives meaning to texts. Textbook publishers have responded to the research to satisfy the educational demands during time periods. Through the continuous debates and reading wars, Pressley (2006) reported that a single approach was not optimal for improving students’ reading achievement. Cunningham and Shagoury (2005) concluded “at risk” students needed a balanced approach to build comprehension and decoding skills. Spiegel (1998) goes on to say that balanced literacy is built upon solid research.

Reading debates have had an impact on reading initiatives mandated by the federal government to improve student reading achievement. Funding has been provided to help close the achievement gap that exists among ethnic minorities. Although the National Reading Panel (2000) did not address the achievement gap, it noted that systematic phonics instruction should be integrated with other reading instruction to create a balanced reading program. From this report, the five major components of reading instruction were presented. After the findings from
the National Reading Panel (2000), the No Child Left Behind Act was passed in 2001 to address reading concerns. According to NAEP, reading scores of students in Grade 4 continued to remain relatively flat across the nation. As a result, the federal, state, and local educational agencies have continued to update and develop initiatives and policies to address reading concerns. The State of North Carolina has developed the Career and College: Ready, Set, Go! Initiative with a goal to graduate all students from high school prepared for further education and successful employment (North Carolina Public Schools, 2014). The North Carolina Read to Achieve Policy addressed reading concerns for primary grades to ensure all students are proficient readers by the end of third grade. The mClass: Reading 3D assessment continued to be used to gather student reading data as teachers use reports to inform reading instruction.

Technology contributes to teachers being able to differentiate instruction. Used to assess or present information to students, technology continues to be used to help improve students’ reading achievement. As T. H. Wang (2008) indicated, technology provides opportunities for students to learn.

As teachers continue to assess and enhance students’ reading achievement, they must be exposed to professional development to positively impact professional practices and beliefs. Professional development and teacher preparation makes a difference in student reading achievement (Snow et al., 1998). As outlined in the chapter, Guskey (2000) presented several professional development models, along with five critical levels of professional development, to create effective teachers.
With the statement of the problem, the significance and purpose of this study, and the extensive review of literature, the researcher’s intention is to determine the answer to the following question relating to mClass: Reading 3D on the local and state level:

*To what extent, if any, do teachers use student data to determine instructional practices that may impact student achievement?*

Additionally, other questions relating to this study continuously surfaced that greatly affect student data to determine instructional practices that may impact student achievement. The reoccurring questions are the following:

- To what extent, if any, has mClass: Reading 3D impacted students’ reading achievement in second grade?
- To what extent, if any, did continuous and ongoing professional development associated with mClass: Reading 3D provide teachers with the necessary skills to impact students’ reading achievement?
CHAPTER 3: RESEARCH DESIGN/METHODOLOGY

Research Methodology

The purpose of this study was to explore the relationship that exists between the impact of mClass: Reading 3D on reading achievement among second grade students as well as the impact of quality professional development associated with the implementation of this program. This chapter specified the method of research, a description of the research design, a description of participants being studied, the procedures and instrumentation utilized, the data collection process, methodological assumptions and limitations, and how the data were to be analyzed.

A descriptive study using both qualitative and quantitative data collection was used to address the research questions. Greene and Carracelli (1997) found that qualitative and quantitative data were often used to gain a greater understanding of the construct of interest. John Creswell (2009) defined qualitative and quantitative research as:

an approach to inquiry that combines or associates both qualitative and quantitative forms. It involves philosophical assumptions, the use of qualitative and quantitative approaches, and the mixing of both approaches in a study. Thus, it is more than simply collecting and analyzing both kinds of data. It also involves the use of both approaches in tandem so that the overall strength of a study is greater than either qualitative or quantitative research. (p. 4)

Quantitative data includes closed-ended information regarding attitude, behavior, or performance instruments (Creswell, 2009). The data may involve using a closed-ended checklist on which the researcher checks the behaviors seen. Sometimes quantitative information is found in documents, census records, or attendance records. The analysis consists of statistically analyzing scores collected on instruments, checklists, or public documents to answer research questions or to test hypotheses.
In contrast, qualitative data consists of open-ended information that the researcher gathers through interviews with participants. The general, open-ended questions allow the participants to report answers in their own words. Also, qualitative data may be collected by observing participants or sites of research, gathering documents from a private (e.g., diary) or public (e.g., minutes of meetings) source, or collecting audiovisual materials (e.g., videotapes or artifacts; Creswell, 2009). The analysis of the qualitative data (words or text or images) typically follows the path of aggregating the words or images into categories of information or themes and presenting the diversity of ideas gathered during data collection.

Using descriptive statistics provides richer data for a comprehensive analysis (Elliot, 2005). For example, surveys, a traditional quantitative data source, are being used in ethnographic qualitative research. Narrative stories, associated with qualitative research, are being linked to quantitative event history modeling (Elliot, 2005). By mixing the datasets, the researcher provides a better understanding of the problem than if either dataset had been used alone. There are three ways in which mixing occurs: merging or converging the two datasets by actually bringing them together, connecting the two datasets by having one build on the other, or embedding one dataset within the other so that one type of data provides a supportive role for the other dataset (Creswell & Plano Clark, 2007). It is not enough to simply collect and analyze quantitative and qualitative data; they need to be “mixed” in such a way that together they form a more complete picture of the problem than they do standing alone. Using qualitative and quantitative data permits researchers to address more complicated research questions and collect a richer, stronger array of evidence than can be accomplished by any single method alone (Yin, 2009). Thus, the researcher chose descriptive statistics to gather beneficial and rich data to answer research questions.
Statement of the Problem

Reading proficiently by the end of third grade is a crucial marker in a child’s educational development (Annie E. Casey Foundation, 2013a). Failure to read proficiently is linked to higher rates of school dropout, which suppresses individual earning potential as well as the nation’s competitiveness and general productivity (Annie E. Casey Foundation, 2013a). The decline in third-grade North Carolina End-of-Grade reading scores of students has resulted in an increased emphasis on improving academic achievement of students in grades kindergarten through second grade (NCDPI, 2010). These diminishing student achievement scores, based on state standardized achievement test results, have resulted in a sense of urgency for public school districts to implement a diagnostic reading assessment program to improve student performance.

The NAEP benchmarks were designed as high standards for children to reach as teachers push them toward the standards (McKenna & Stahl, 2003). If second-grade students at grade level experience three years of no academic growth during any of the next eight years, the student may score three years behind on the college entrance SAT. A year without reasonable academic growth places the children at risk of academic failure (Fielding et al., 2007). These concerns have led to the mandated adoption of mClass: Reading 3D in the public elementary schools in North Carolina as outlined in the Read to Achieve Policy (NCDPI, 2012), part of the Excellent Public Schools Act, which became law in July 2012. mClass: Reading 3D is an observational reading assessment software for students in grades K-5 that obtains a complete picture of each student’s ability to read with comprehension. There was a need to explore the relationships that exist between the impact of mClass: Reading 3D on student achievement among second-grade students and the impact of quality professional development associated with the implementation of this program. This study attempted to determine the extent to which
mClass: Reading 3D has impacted students’ reading achievement in second grade, if any, and how teachers use student data from the program to determine instructional practices that may impact student achievement. Additionally, researcher analyzed data collected to report if and how continuous and ongoing professional development associated with mClass: Reading 3D provided teachers with the necessary skills to impact students’ reading achievement effectively.

**Research Question**

The following research question was considered for this study:

*To what extent, if any, do teachers use student data to determine instructional practices that may impact student achievement?*

Additionally, other questions relating to this study continuously surfaced that greatly affect student data to determine instructional practices that may impact student achievement. The reoccurring questions were the following:

- To what extent, if any, has mClass: Reading 3D impacted students’ reading achievement in second grade?
- To what extent, if any, did continuous and ongoing professional development associated with mClass: Reading 3D provide teachers with the necessary skills to impact students’ reading achievement?

**Research Design**

This study was grounded in program evaluation using a participatory-oriented approach. A program evaluation examines programs to determine the worth and to make recommendations for refinement and success (Lodico, Spaulding, & Voegtle, 2010). Many program evaluation studies are found in the field of education to access the quality of a curriculum, to determine the value of a specific program, or to provide evidence of initiative outcomes for outside funding.
agencies (Fitzpatrick et al., 2011). As these researcher noted, an evaluation can provide both
decision-making and program involvement. A program evaluation report is judged on its data
collection methods and whether the information is used by those who are in the position to make
programmatic changes (Lodico et al., 2010). Purely quantitative research designs (e.g.,
correlational designs or experimental designs) were not deemed appropriate for this study
because the purpose of the evaluation was not to validate or confirm the relationships between
variables and then to generalize that information to the larger population. Rather, the researchers
sought to study selected variables impacting the implementation and outcomes of the literacy
initiative, discover the relationships and themes among those variables, and then use that
information to make decisions about and improve the program. Other approaches to qualitative
research (e.g., case study research and historical research) were also not deemed appropriate
because the study was not conducted simply for the purpose of description or to develop theories
that explain educational phenomena. Rather, the researcher was interested in identifying what
was working and should be maintained in the initiative and, conversely, what was not working
and should be changed as well as to evaluate initial outcomes (e.g., its effects on students and
teachers).

Scriven (2007) distinguishes between the formative and summative roles of evaluation.
Through this program evaluation, formative data were collected to make recommendations to
improve the structure and the way mClass: Reading 3D is used to improve instruction and
student achievement. Data for summative evaluation were collected for the purposes of
measuring outcomes and determining how outcomes related to the overall judgment of the
program and its successes. These data also help determine if goals and benchmarks have been
accomplished.
Using a participatory-oriented evaluation approach, the researcher was interested in students who are served by the mClass: Reading 3D program (Lodico et al., 2010). The researcher involved program participants including teachers, administrators, curriculum specialists, as well as student data. The focus of the program evaluation helped determine the merit and worth of the program as well as the strengths and weaknesses of mClass: Reading 3D. Furthermore, qualitative and quantitative data generated a rich collection of data to yield a more objective and accurate description of the program’s goals.

**Selection Process**

The three participating rural elementary schools were selected through a purposeful (Patton, 1990) or criterion-based (LeCompte & Preissle, 1993) sampling procedure. Purposeful sampling allows the researcher to gain the most insight by using specific criteria which “directly reflect the purpose of the study and guide in the identification of information rich cases” (Merriam, 1998, pp. 62–63). According to Patton (1990), “information rich cases are those from which one can learn a great deal about issues of central importance to the purpose of the research, thus the term purposeful sampling” (p. 169).

The purposeful or criterion-based sample included the following criteria: a rural public elementary school in the State of North Carolina that implemented the mClass: Reading 3D program during the 2010/2011 school year, with each racial/ethnic group representative of the community and school district.

According to state guidelines, a student may be identified by the public school district as economically disadvantaged if the student meets the eligibility requirements for the federal free or reduced price lunch programs or if the family receives food stamp benefits (U.S. Department of Education, 2013b).
The three elementary schools included enrollment with 40% or more economically disadvantaged, meeting federal guidelines for a Title I Part A funding to meet the learning needs of all students (U.S. Department of Education, n.d.).

The final criterion for selecting elementary schools focused on major racial/ethnic group percentages within each school population identified by the North Carolina School Report Card (2013). Over the last 10 years, the small rural public school district became more diverse, with the majority of students being Native Americans. Thus, this study identified diverse small rural public elementary schools that represented the major racial/ethnic groups of students tested on the state achievement tests. North Carolina identifies the major racial/ethnic groups for accountability purposes as Native American, Caucasian, African American, Hispanic, Multi-Racial, and Other. Through purposeful sampling, the three selected public rural Title I elementary schools mirrored a diverse school population.

The school district is located in the largest county by land area in the State of North Carolina, including 949 square miles in total (605,100 acres) and two square miles (0.23%) of water. The county was incorporated in 1787 from Bladen County and was named for Col. Thomas Robeson of the Revolutionary War (Robeson County, 2013). Fifteen municipalities serve the county. Located approximately 1 ½ hours from the beaches and 3 hours from the mountains, the county is traversed frequently as Interstate 95 runs directly through the county. Interstate 74 runs East/West through the county, which connects the beaches with the mountains.

According to the 2010 U.S. Census Bureau, the county had a population of 134,168, a significant increase from the 2000 U.S. Census of 123,339 (U.S. Census Bureau, 2013). It started with a population of 5,356 in 1797 and has grown tremendously over the years. A report published in December 2013 by North Carolina Department of Commerce, Labor & Economic
Analysis Division showed a 2012 population of 136,657. The county is known for its tri-racial population, mainly consisting of Caucasians, African Americans, and Lumbee Indians. An estimated 62.6% of the county’s population lives in “rural residence designation” and 37.4% lives in an “urban residence designation.” Table 4 details the racial breakdown of the county.

The school district has approximately 24,000 students enrolled in 44 schools, approximately 2,100 certified staff (including teachers, principals, assistant principals, and counselors) and 1,100 classified employees. The school district has developed partnerships with the two local colleges and gained business and industrial support. Employees serve as mentors and counselors to assist students in making better career decisions. Over 1,600 volunteers devoted over 48,000 hours of service to education in the school district during the 2012-2013 school year (Robeson County, 2013). The district’s goal is to provide “students with the knowledge, skills, and attitude that will ensure each one is a strong student, a confident person, a responsible citizen, and a contributing member of our society” (Robeson County, 2013).

The county’s Comprehensive Annual Financial Report for fiscal year ending June 30, 2012, shows the net asset for school capital outlay as $11,441,247.00, with a fund balance of the same amount. Governmental activities in education totaled $16,113,200, and school current expenditures totaled $12,375,000.

Over 13,000 acres are available for business expansion (Public Schools of Robeson County, 2013). Eleven industrial parks are located throughout the county. Additionally, seven libraries, 26 county parks, and several town parks are available to serve the public (Comprehensive Annual Financial Report, 2012).

*Note.* (U.S. Census Bureau, 2013).
The county’s economic condition has experienced challenges from the current recession. From 2003 to 2008, the county’s financial report (2012) indicates there were 36 announcements for new and expanded industry. Since 2008, the number has declined; however, two of the major industries within the county have completed major expansions during 2009–2010. During 2011, Steven Roberts Original Desserts, LLC (SRO) was added to the county’s industries, which manufactures and sells frozen desserts and cookies to major restaurant chains, distributors, and retailers (i.e., Red Lobster, Olive Garden, Chili’s, Applebee’s Domino’s, Sara Lee, Kroger, Sam’s Club, and Wal-Mart; Comprehensive Annual Financial Report, 2012).

The unemployment rate slightly exceeded 13.9% for most of 2011 (Comprehensive Annual Financial Report, 2012). A report issued by Commerce Economic Development in December 2013 shows an August 2013 unemployment rate of 12.0% and a 2012 annual rate of 13.0%. The same report shows the 2000 Census per capita income of $13,224.00. The county’s per capita money income in the past 12 months (2012 dollars) was $15,644.00 compared to $25,285 reported for the state of North Carolina (U.S. Census Bureau, 2013). The median household income, 2008–2012, for the county reported by the U.S. Census Bureau (2013) is $30,167.00, compared to $46,450.00 for the state. The percentage of persons living below the poverty level, 2008–2012, was 31.9% for the county and 16.8% for the state. Table 5 details a county/state comparison.

Participants

Teachers, Principals, and Transformational/Instructional Coaches

For this study, 44 K-3 teachers were selected from three rural elementary schools. To increase the validity of the findings, the researchers interviewed eight administrators who implemented mClass: Reading 3D. Seven additional interviews were conducted with

transformational coaches who work with the North Carolina Department of Public Instruction. These individuals have a major role in providing support for the public schools in North Carolina implementing the mClass: Reading 3D program (see Table 6).

Students

The selected school district’s population of grade K-3 students consisted of 8,555 students. The racial breakdown of all elementary schools in the district includes 45% Native American, 30% Caucasian, 20% African American, 3% Multi-Racial, and 2% Other. Seventy-eight percent of the students were economically disadvantaged, which entitled them to receive free and reduced lunch. For this study, Tables 6–9 highlighted the participant demographics and mClass Reading: 3D scores from second grade students of selected schools.

Data Collection

Merriam (1998) stated that data are usually derived from interviews and field observations, while Yin (2003) recommended gathering data from the following: online documentation, archival records, interviews, direct observations, participant observations, and/or physical artifacts. Surveys, interviews, and online documentation were used to gather data for this study.

Surveys

Surveys constitute an important data collection evaluation tool (Braverman, 1996). A clear and simple survey yields sufficient and rich data through a few closed and open-ended questions (Edmonson & Irby, 2008). In order to formulate an appropriate survey, the researcher developed questions regarding the impact of mClass: Reading 3D as it relates to student reading achievement, instructional practices, and professional development.

Common survey uses include choosing an intended target audience for a program to learn of their perceived needs or their behaviors, knowledge, skills, or attitudes that may be the focus of the program or their characteristics (Fitzpatrick et al., 2011). Edmonson and Irby (2008) explained that “the survey is long enough to gather important information on the topic; however, a follow-up interview may be necessary with some of the respondents for clarification purposes” (p. 72). There are limitations to administering surveys in a qualitative study. Unfortunately, one runs the risk of losing the opportunity to “dig deeper” into a participant’s response when only a survey is used (Edmonson & Irby, 2008). However, “evaluators typically find that directing respondents to a web site that contains the survey make the respondents, particularly if they are employees or clients, feel more anonymous, since their e-mail addresses are not linked to their responses” (Fitzpatrick et al., 2011). Studies have shown that response rates to electronic surveys are somewhat lower than mailed surveys (Fricker & Schonlau, 2002); however, to increase the response rate, the researcher chose a recommendation from Converse, Wolfe, Huang, and Oswald (2008). Using a mailed announcement of a web-based survey led to a higher response rate than an email with a link to the web-based survey. Instead of mailing the announcement, a detailed letter was presented to select participants that included a survey link. Using surveys and interviews, the first phase of the study was described as qualitative. Participants were asked to voluntarily participate in a survey to help researcher gather data. The researcher met with each administrator of the three selected schools to explain the study. The purpose of the survey was to determine the extent to which professional development impacts teacher preparation with the use of assessment data to improve instruction and to what extent the implementation of the program has impacted instruction relative to student accountability. Documenting and analyzing survey results, online documentation, and focus group interview
results may help the selected school district evaluate the implementation of mClass: Reading 3D and determine the extent to which the program has impacted student achievement and instructional practices.

The survey was web-based and accessed through a provided link. One advantage to web-based surveys is that participants’ responses are automatically stored in a database and easily converted to Qualtrics-formatted numeric data. This study was explained in an open meeting to the selected certified teachers. The meeting provided an explanation of the study, decreasing the response rate error and increasing a relatively high response rate. An informed consent form has been kept on file (see Appendix C). This document detailed the program evaluation, described risks involved, and explained that participation in the study is voluntary, and that participants had the right to withdraw at any time without consequences. Afterwards, the survey, which included a cover letter (see Appendix D) with an explanation of the purpose of the study, was delivered to the selected sample population. To ensure a high response rate, the researcher sent an email reminder, including the link to the survey, for all participants who had not completed the survey within five calendar days after the first email had been sent. For participants who had not completed the survey, ten days later another reminder was sent. Lastly, for those who had not completed the survey, a final reminder was sent through email with a final survey deadline date.

Collected data were stored electronically in a password-protected file. The researcher assigned participants an identifier and collected the data under secure identification to maintain confidentiality.

The survey consisted of 24 questions (see Appendix E). Various formats consisting of multiple choice questions, asking for one or all options that apply; self-assessment items
measured on a 7-point Likert Scale; and open-ended written response questions. The first section of five questions collected information concerning the participants’ position and teaching experience. The second section had two questions designed to obtain feedback about the impact of mClass: Reading 3D on student assessment. A third portion included three questions relating to data-driven instruction. Eight questions in the next section gathered information regarding teachers’ professional development for the reading assessment. Last of all, six questions included open-ended responses to provide additional data.

After developing possible questions, the researcher discussed with a North Carolina Department of Public Instruction (NCDPI) mClass: Reading 3D specialist (A. Evans, personal communication, February 19, 2014) and drew upon personal experiences with this program to modify the survey questions. Additionally, the researcher shared the questions with two East Carolina University (ECU) professors from the Educational Department of Graduate Studies to ensure the correct wording. The NCDPI mClass: Reading 3D specialist and the two ECU professors selected to pilot the survey were asked to comment on the categories, clarity of questions, scale, and provide suggestions to ensure validity.

**Interviews**

To increase the validity of the study, face-to-face interviews were conducted with eight administrators within the selected school district. This same process, which is grounded in the interpretivist paradigm, was used to collect data from seven transformation coaches from the North Carolina Department of Public Instruction, which is grounded in the interpretivist paradigm (Schwandt, 2000). According to Sipe and Constable (1996), the interpretivist attempts to describe and understand the point of view of someone else experiencing the situation.
Understanding the subjective meaning of action can be done in an objective manner (Schwandt, 2000).

Appointments were scheduled with the eight administrators who implemented mClass: Reading 3D at their school and the seven experts from educational agencies employed by the North Carolina Department of Public Instruction. These selected educators received a consent form explaining the purpose and procedures to ensure anonymity. Additionally, the consent form included risks associated and indicated that the participants may withdraw from the study at any time. Once the researchers obtain consent, interviews were conducted.

To prepare for the interview process, the researcher became familiar with the research on conducting qualitative interviews. Kvale and Brinkmann (2009) and Rubin and Rubin (2012) provided similar steps in conducting interviews. Kvale and Brinkmann (2009) provided seven sequential stages of an interview (see Figure 4). These seven steps validate the findings. Additionally, the researcher incorporated Rubin and Rubin’s (2012) responsive interview model by modifying questions asked during interviews, as needed, to retrieve data. A pilot interview with an administrator and a transformational coach established reliability and dependability of clearly stated questions and ensure continuous conversations.

Gathering data via interviews is one powerful way to understand our fellow human beings (Fontana & Frey, 2000). Qualitative researchers take pride in discovering and portraying the multiple views from interviews conducted. The interview is the main road to multiple realities (Stake, 1995).

Interview questions were asked in a semi-structured format.

In semi-structured interviewing, a guide is used, with questions and topics that must be covered. The interviewer has some discretion about the order in which questions are asked, but the questions are standardized, and probes may be provided to ensure that the

<tr>
<th>Seven Stages of an Interview Inquiry (Kvale &amp; Brinkmann, 2009)</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Thematizing: Formulate the purpose of an investigation and the conception of the theme to be investigated before the interviews start. The why and what of the investigation should be clarified before the question of how—method—is posed.</td>
</tr>
<tr>
<td>2. Designing: Plan the design of the study, taking into consideration all seven stages of the investigation, before interviewing. Designing the study is undertaken with regard to obtaining the intended knowledge and taking into account the moral implications of the study.</td>
</tr>
<tr>
<td>3. Interviewing: Conduct the interviews based on an interview guide and with a reflective approach to the knowledge sought and the interpersonal relation of the interview situation.</td>
</tr>
<tr>
<td>4. Transcribing: Prepare the interview material for analysis, which generally includes a transcription from oral speech to written text.</td>
</tr>
<tr>
<td>5. Analyzing: Decide, on the basis of the purpose and topic of the investigation and of the nature of the interview material, which modes of analysis are appropriate for interviews.</td>
</tr>
<tr>
<td>6. Verifying: Ascertain the validity, reliability, and generalizability of the interview findings. Reliability refers to how consistent the results are, and validity means whether an interview study investigates what is intended to be investigated.</td>
</tr>
<tr>
<td>7. Reporting: Communicate the findings of the study and the methods applied in a form that lives up to scientific criteria, takes the ethical aspects of the investigation into consideration, and results in a readable product.</td>
</tr>
</tbody>
</table>

*Figure 4. Seven Stages of interview inquiry.*
Kvale and Brinkmann (2009) discuss the power asymmetry in which the research interview should not be regarded as a completely open and free dialogue between the egalitarian partners. This type of interview creates unequal power among the interviewer and the interviewee, is based on the researcher’s agenda, leads to the researchers’ interpretations, and contains “counter control” elements by the interviewee, who may withhold information. To protect against this asymmetry, the authors suggest more collaborative interviewing, where the interviewer and interviewee approach equality in questions and responding. Eleven questions were developed to conduct principal and transformational/instructional coach interviews (see Appendix F). Questions focused on student data from mClass: Reading 3D, how data reports they are used, specific features of the program, if/how they are used to impact student reading achievement, and to identify the strengths and weaknesses of the program. Using the semi-structured interview format assisted the researcher as she delved deeply into responses to understand thoroughly the answers provided.

Interviews took place over a two-week period in the summer of 2014. The researcher had a list of questions to address. During the focused group interviews, a semi-structured process was used to allow new questions to be explored depending on the situation. This flexible method encouraged the respondents to freely discuss other topics or themes if the opportunity arises. To ensure accuracy, all interviews were tape recorded. This process provides more detail for data analysis and remains to attest to the veracity of the process (Fitzpatrick et al., 2011). By gathering the interview data in a timely manner, the researcher reflected on the collected data and analyzed themes.
To validate the interview questions, a pilot study was conducted with three administrators within the district. Additionally, three mClass: Reading 3D experts employed by the North Carolina Department of Public Instruction reviewed the questions to be used in the interviews. Questions were shared with two East Carolina University professors in the Department of Educational Leadership.

Assessment Data

The second phase of the research study was based on quantitative data. mClass: Reading 3D data for students enrolled in second grade during the 2012–2013 school year were obtained from the NC Department of Public Instruction. Data were analyzed to determine to what extent mClass: Reading 3D has impacted students’ reading achievement in second grade and how teachers used the student data to determine instructional practices that may have impacted student achievement.

Data Analysis

Descriptive statistics was used to analyze data from the survey questions. Interviews were audio-recorded. Frequencies and percentage response distributions are presented in various charts and graphs. This provided an overall picture of what the data look like as common patterns and themes emerge. Creswell (2013) discusses the need to display data in visual forms such as charts and graphs. Representing results will involve a discussion of emerging themes. He also identifies different sources of data to cite multiple items of evidence, including perspectives from individuals in a study to show divergent views. For quantitative research, Creswell discusses the comparison of results with the initial research questions. The researcher analyzed transcripts to determine the most important factors that emerged from each interview. Emerging themes were documented. As a result, the researcher ensured questions relating to the
themes were included in the survey distributed to the sample of certified teachers. Frequency distributions were among the descriptive statistics used and summarized.

The quantitative portion of the program evaluation examined student performance. mClass: Reading 3D scores from the 2012–2013 school year were obtained from second-grade students enrolled at the three identified schools. The Beginning of Year (BOY) data were compared to the End of Year (EOY) data to determine student growth. A graph was created to display growth among second-grade students from the three schools.

**Interpretive Analysis**

Interpretative data analysis provided meaning to the quantitative statistics. The logic of the interpretive model parallels that of the inductive model in that pieces are put together in meaningful relation in order to construct explanations that help readers make sense of what is being examined. Data gathered on teacher and administrator surveys and interviews of mClass: Reading 3D as it relates to professional development and accountability allowed the researcher to expand on the findings from the descriptive analysis. An interpretive analysis allowed the researcher to go beyond data description and give meaning to quantitative statistics (Creswell, 2003).

**Construct Validity**

Creswell (2013) considers validation to be an attempt to assess the accuracy of findings, as best described by the researcher and participants. Validity has been upheld as the survey and interview questions are characteristic of the study’s design. The language in the survey was clear and relevant to the intended participants, regardless of their level of expertise. The group of participants in the study was representative of the population being studied. They reflected the overall diversity and range of the entire population of K–3 students. Teachers surveyed were
from grades K–3. Principals and transformational/instructional coaches who participated in the focus group interviews shared their experiences with schools involved in the implementation of mClass: Reading 3D. This process ensured that average survey results closely mirrored the trends of the overall K–3 population. With the considerations mentioned above, the survey was validated statistically. Instrument reliability refers to a survey yielding the same results to repeated responses. Administering the same survey to other groups of participants within the rural Title I district in North Carolina would likely produce similar results. External validity was guarded by choosing a representative sample, and was strengthened by the gathering of a representative sample.

The researcher used surveys, interviews, and test results to triangulate measures of the research questions, thus increasing the validity. Triangulation involves the careful reviewing of data collected through different methods in order to achieve a more accurate and valid estimate of qualitative results for a particular construct. According to O’Donoghue and Punch (2003), triangulation is a “method of cross-checking data from multiple sources to search for regularities in the research data” (p. 78). The data for this program evaluation were triangulated based on surveys, online documentation, and interviews. According to Creswell (2013), in triangulation, researchers make use of multiple and different sources, methods, investigators, and theories to provide corroborating evidence. As data are collected and analyzed, the researchers look for themes in different sources of data. This process provides validity to the findings of the study.

Through data analysis and coding methods, emerging themes were documented in the collection to increase validity of findings (Yin, 2009). Using data from the survey, interviews, research, and the second-grade mClass: Reading 3D data, all information were used to achieve a
detailed level of inquiry to help describe the implementation of mClass: Reading 3D and its impact on student reading achievement and instructional practices used by the teacher.

Threats to internal and external validity had been noted. A restriction of range may serve as a threat to external validity in this study. Heterogeneity of the units under study is a limitation to validity, due to the population chosen for the study.

Confidentiality

Participation in this study was voluntary and participants had the option to withdraw at any time. While it was not the intent of the investigators to ask intrusive questions, some participants may have been sensitive to revealing information. The information to be gathered was intended to give participants a high degree of control over the information shared. Participation had no impact on teacher performance evaluations.

Documentation collected was confidential. Published reports will not divulge information that may identify a subject or school. All files have been stored at a location outside of the school. Gathered data were used only for analysis, discussions, conclusions, and recommendations. Findings will be disseminated to the school anonymously. After five years, collected data will be destroyed.

Research Permission and Ethical Consideration

Weis and Fine (2000) address ethical issues that may occur during the research process:

They ask us to consider ethical considerations involving our roles as insiders/outsiders to the participants; assessing issues that we may be fearful of disclosing; establishing supportive, respectful relationships without stereotyping and using labels that participants do not embrace; acknowledging whose voices will be represented in our final study; and writing ourselves into the study by reflecting on who we are and the people in the study. (Creswell, 2013, p. 56)
In addition, Hatch (2002) indicates that researchers need to be sensitive to vulnerable populations, imbalanced power relations, and placing participants at risk. While no participants have been placed at risk, the researchers for this study have considered the ethical issues above.

To ensure that familiarity would not skew data collection, the researcher chose not to survey any participants at her school. In addition, the researcher chose seven transformational/instructional coaches employed by the North Carolina Public Schools to obtain helpful information when collecting data. Participants were cognizant of the classification of each participant, including (a) certified teachers who administered the mClass: Reading 3D assessment, (b) administrators who served a school with grades K–3, and (c) the transformational/instructional coaches who had in-depth knowledge of mClass: Reading 3D. Findings were reported based on data collected from participants and the qualitative data from mClass: Reading 3D scores from second-grade students enrolled in the selected schools during the 2012–2013 school year.

**Compliance with Institutional Review Board**

The researcher complied with Institutional Review Board (IRB) regulations. Equally important, permission to conduct the study in the small rural public school district in North Carolina was obtained from the district superintendent and the assistant superintendent of curriculum and instruction.

Hatch (2002) summarizes major ethical issues that researchers need to anticipate and consider during research studies. “Giving back to participants for their time and efforts in our projects—*reciprocity*—is important, and we need to review how participants will gain from our studies” (p. 55). Once findings were disseminated to the school district, they were also forwarded to the eight administrators who participated as well as the administrators at the three
elementary schools. Results will also be shared with the seven experts on mClass: Reading 3D and the local education agency.

**Conceptions/Assumptions of Chosen Methodology**

Qualitative research focuses on understanding how participants construe their experiences and how they theorize their environment (Merriam, 2009). Lodico et al. (2010) indicate that qualitative research targets social phenomena and allows participants to explain their perceptions and experiences with an identified topic. They also explain that a program evaluation is designed to observe programs to determine the strengths and weaknesses and to make recommendations for improvements of the program.

During the program evaluation, the researcher worked closely with participants, identified decisions made about mClass: Reading 3D, and collected information about the relative advantages and disadvantages of the program. Using a participative approach, relevant stakeholder groups were identified and information was obtained on individual views of the program. Data collection focused on qualitative measures to provide multiple perspectives. To uphold the validity of the results, stakeholders at various stages of program implementation were included to help build evaluation capacity and to ensure the methods used, the interpretation of the results, and the final conclusions reflect the multiple perspectives of the stakeholders (Fitzpatrick et al., 2011). Students of the participants were comparable. Taking into consideration the academic ability, socio-economic status, and geographic location, data collected may be generalized to other schools in the same small rural school district in North Carolina implementing the mClass: Reading 3D program. The final methodological assumption was that participants who completed the survey have had professional development relating to mClass: Reading 3D prior to the administration of the assessment.
Summary

The decline in third-grade North Carolina End-of-Grade reading scores has placed an increased emphasis on improving academic achievement of students in grades kindergarten through second grade led to the statement of the problem. Chapter 3 provided the rationale for the selected research methodology. Qualitative and quantitative data allowed a strong array of evidence to be collected and analyzed (Yin, 2009). This study used collected data to address the research questions. The selection process consisted of a purposeful sample which met the following criteria: a rural public elementary school in the State of North Carolina that implemented the mClass: Reading 3D program during the 2010-2011 school year, with each racial/ethnic group representative of the community and school district.

A rich description of the county provided the geographic location and total population. Chapter 3 highlighted the county’s racial make-up, economic conditions, unemployment rate, and quick facts. The three schools chosen to participate in the study were Forest Lane, Sycamore, and Pine Brook Elementary. Data collection was obtained through surveys, interviews, and mClass: Reading 3D assessments. Descriptive statistics were used to analyze data. Qualitative data were gathered through surveys and interviews. The quantitative portion of the program evaluation examined student reading performance.

Chapter 3 concluded by detailing steps taken to address confidentiality, research permission, and ethical considerations of participants. The role of the researcher was explained in detail to ensure internal and external validity was protected during the entire process. The benefits of a program evaluation were outlined to provide feedback in regards to the selected research question.
CHAPTER 4: RESULTS AND RECOMMENDATIONS

The purpose of this study was to explore the relationship that exists between the history of reading instruction, the impact of mClass: Reading 3D on student achievement in second grade, and the impact of quality professional development through a program evaluation. Data from this study was used to inform the implementation process of mClass: Reading 3D that will have a positive impact on students’ reading achievement. Specifically, the study explored the following question:

To what extent, if any, do teachers use student data to determine instructional practices that may impact student achievement?

Data Overview

Both qualitative and quantitative data was collected in this study from several sources to increase validity in the findings. First, this study analyzed data from an online survey administered to 44 teachers from three rural elementary schools who have implemented mClass: Reading 3D on a daily basis. Gathering data from teachers was vital to this study to highlight experiences and perspectives from those actually inside the classroom who directly work with the program. Secondly, interviews were conducted with eight administrators and seven curriculum coaches who have directly facilitated the implementation of mClass: Reading 3D program. Gathering data from those in the administrative capacity broadens program perspectives and experiences. Thirdly, student scores from the 2012–13 End of the Year Benchmark were analyzed from three schools in an effort to determine the impact mClass: Reading 3D on student achievement both on a local level and in other rural schools with similar demographics.
Qualitative Data—Teacher Survey

Forty-four teachers were asked to complete a survey that focused on the impact of mClass: Reading 3D on student achievement, utilization of data to drive instruction, and professional development. All 44 teachers (100%) responded to the survey. These teachers taught in three rural Robeson County Schools that shared similar demographic data relative to the student population, free and reduce lunch rate, and the time frame of implementation of mClass: Reading 3D. The survey consisted of 18 multiple choice type questions and six open-ended questions. Different scales were used to obtain responses from the teacher survey responses. When questions asked for current teaching position, response choices included kindergarten teacher, first-grade teacher, second-grade teacher, or third-grade teacher. Other questions asked responders to choose the number of years taught in the current grade level and to choose the number of years of experience in education. One question allowed responders to choose the highest degree obtained on a scale using the following choices: BA/BS Degree, Master’s Degree, or Doctorate Degree. Additionally, on a scale ranging from 1 to 4 years, responders indicated the number of years they have implemented the mClass; Reading 3D assessment.

Next, seven questions allowed responders to rate components of the assessment program using a Likert-type scale including choices such as positive impact, somewhat positive impact, somewhat negative impact, and negative impact. A time scale was used to gather data about the time responders take to administer mClass: Reading 3D benchmark assessment per student and how much staff development was provided prior to implementation. Responders also provided how often the assessment data are used to modify student instruction and how frequent progress monitoring data are used for setting student goals using a scale ranging from daily, weekly,
monthly, or never. Frequency tables were used to measure how responders used data to drive instruction and identify how often which resources have been used for mClass: Reading 3D support. The survey was created and distributed to teachers using the web-based software program Qualtrics (East Carolina University, 2015; see Appendix E).

The first five questions of the teacher survey focused on general information about the responders and their level of education. Questions six and seven focused on student assessment while questions eight through eleven focused on data driven instruction. Next, questions twelve through eighteen focused on professional development (see Appendix H). The survey ended with six open-ended questions that targeted suggestions for improvement and allowed responders to explain “why” they feel the way they feel.

**General Information Teacher Survey Questions**

*Based on general information questions*, results showed that more first-grade teachers, 12 out of 44 (27%) participated in this study. The lowest level of participants was second grade teachers, 10 out of 44 (23%). The general information questions also revealed that 23 out of 44 total responders (52%) had taught in their grade level 0–3 years. Fourteen out of 44 responding teachers (32%) had 11-20 (32%) years of experience in education. The smallest percentage of responders, 8 out of 44 (18%) have 4–10 years teaching experience. Most of the responders, 32 out of 44 (73%), hold a BA/BS degree. Seventy-four percent of the responders, 32 out of 43, have implemented the mClass: Reading 3D assessment for 3 or more years. Twenty-six percent (11 out of 43), have implemented the assessment 2 or fewer years (see Figure 5).
Figure 5. Number of years responders who have implemented the mClass: Reading 3D assessment.
Survey Questions about Utilization of Data to Drive Instruction

The next sets of questions focused on the extent teachers utilized available data to drive their daily instruction. Question 8 asked teachers, “How often do you use mClass: Reading 3D to modify student instruction?” (see Figure 6). The answers varied among the responders. However, 48% of teachers (20 out of 42) indicated they modified student instruction on a weekly basis. Thirty-one percent of K-3 teachers (13 out of 42) utilized mClass: Reading 3D data to modify instruction on a monthly basis, while one teacher (2%) indicated that she/he never modified instruction based on mClass: Reading 3D data. Twenty out of 42 responders (48%) used mClass: Reading 3D data to modify student instruction on a weekly basis, while 13 out of 42 responders (31%) used the data on a monthly basis. Eight out of 42 responders (19%) used the data daily while one responder never used the data to modify student instruction.

Question 9 asked teachers the following, “How do you use your data to drive instruction?” (see Figure 7). A frequency scale was utilized to display teacher choices. Teachers were able to choose from the following choices: small group instruction, early intervention, differentiating instruction, PLC’s, grade level planning, parent conference, purchase of classroom materials, all of the above, and none of the above. Teachers were also allowed to specify and give other answers that were not in the provided list. The most popular choices among responders were small group instruction, differentiating instruction, and parent conference. Seventy-four percent of responders (31 out of 42) chose small group instruction, while 67% of responders (28 out of 42) selected differentiating instruction. Parent conference was the next most selected response reflecting 26 out of 42 teachers (62%). With the exception of “none of the above,” the least chosen response was the “purchase of classroom materials.”
Figure 6. Frequency that responders use mClass: Reading 3D to modify student instruction.
Figure 7. How responders use data to drive their instruction.
Only 5 out of 42 teachers (12%) used the data for purchasing materials. No responders specified any other ways the data were used to drive instruction.

Question 10 asked the following, “How frequent is progress monitoring data used for setting student goals?” (see Figure 8). Responses indicated that 45% of teachers (19 out of 42) utilized progress monitoring data for setting student goals on a “weekly” basis. Interestingly, the same percentage (45%) of teachers (19 out of 42) indicated they used the data “monthly” to set student goals. Seven percent of the teachers (3 out of 42) responded that they used the progress monitoring data daily to guide instruction, while one responder never used the data to set student goals. Nineteen out of 42 responders (45%) used mClass: Reading 3D progress monitoring data to set student goals on a weekly basis, tying with the same number of responders who used the data on a monthly basis to set student goals. Only one responder out of forty two (2%) “never” used the data to set student goals. Note that the percentages do not add to 100% due to rounding.

Progress monitoring is a very important component of mClass: Reading 3D. Teachers progress monitor to assess students and to utilize the data to gauge whether students are growing and improving academically. Progress monitoring helps teachers determine a student’s reading performance between benchmark windows. These ongoing assessments help teachers determine the appropriate instructional level for each student throughout the year (Wireless Generation, 2013a).

Survey question 11 asked, “How would you rate the impact of assessment and data to drive instruction at your school?” (see Figure 9). The scale allowed teachers to rate the impact using the following choices: negative impact, somewhat negative impact, somewhat positive impact, or positive impact. Eighty-three percent of the teachers (35 out of 42) felt that utilizing
Figure 8. Frequency with which progress monitoring data are used for setting student goals.
Figure 9. Responders’ ratings of the impact of assessment and data to drive instruction at their school.
assessment and data to drive instruction had a somewhat positive impact at the school. Only 17% of responders (7 out of 42) responded in the negative to somewhat negative range.

Survey question 16 asked responders to rate their overall satisfaction with the implementation of mClass: Reading 3D with components relating to program requirements, resources, and technology. The survey choices allowed responders to rate identified components on a scale with four ratings: negative impact, somewhat negative impact, somewhat positive impact, or positive impact. The data showed that 23 out of 43 responders (54%) felt that mClass: Reading 3D had a somewhat positive impact as it relates to the clarity of the NC assessment administration schedule for benchmarking. Fifty-one percent of teachers (22 out of 43) scored the promptness in receiving assessment results as having a positive impact on the implementation of mClass: Reading 3D. Twenty-seven out of 42 responders (64%) rated using and interpreting the assessment results as having a “somewhat positive impact” on the implementation of mClass: Reading 3D. When analyzing the data for time for testing and administration activities, 19 out of 44 responders (43%) rated this choice as having a somewhat positive impact on the implementation of mClass: Reading 3D. Technical difficulties with mClass: Reading 3D, ease of syncing, and ease of assessment devices relate to the technology components of mClass: Reading 3D. Ten out of 43 responders (23%) indicated technical difficulties had a “somewhat negative” impact on the implementation of mClass: Reading 3D. Twenty-one out of 43 responders (49%) rated the ease of syncing as having a “somewhat positive” impact on program implementation. Lastly, 25 out of 42 responders (60%) rated the ease of assessment devices as having a somewhat positive impact on implementation. In conclusion, 300 responses were recorded for question 16. Eighty-two percent of the responses (247 out 300) revealed a “somewhat positive” to “positive” impact on the implementation of
mClass: Reading 3D, whereas 18% of the responses (53 out of 300) highlighted a “somewhat negative” to “negative” impact on the implementation process (see Figure 10).

**Summary of Teacher Survey Responses**

Obtaining a 100% response rate from 44 teachers added to the reliability of the data collected as well as having all grade levels (kindergarten, first, second, and third) well represented from the three schools. However, after reviewing the data, results showed all responders did not answer every question. The general information questions also revealed that 52% of the total responders (23 out of 44) had taught in their current grade level a total of 0-3 years. Thirty-two percent of teachers had 11–20 years of experience in education, while 74% of responders had implemented the mClass: Reading 3D assessment for 3 or more years. Overall, survey results presented an 82% positive rating (247 out of 300 responses) for the implementation of mClass: Reading 3D and program components, technology, and available resources. On the other hand, 18% of the responses (53 out of 300) highlighted a “somewhat negative” to “negative” impact on the implementation of program components. The survey showed 84% of responders (37 out of 44) rated the effectiveness of mClass: Reading 3D’s impact on student achievement as “somewhat positive” to “positive”, while seven responders (16%) viewed the impact in the “somewhat negative” to “negative” range.

While it is apparent that the teachers utilized data to drive instruction, responses varied in the extent and frequency. For example, 19 out of 42 responders (45%) used mClass: Reading 3D progress monitoring data to set student goals on a weekly basis, tying with the same number and percentage of responders who used the data on a monthly basis to set student goals. Seven percent of responders (3 out 42) used the data on a “daily” basis, while 2% of the responders (1 out of 42) indicated that he/she “never” used the data to set student goals. This may impact a
Figure 10. Responders’ overall satisfaction with implementation of mClass: Reading 3D.
teacher’s ability to truly differentiate and personalize instruction. It also indicated certain components of the program, such as progress monitoring, are not being utilized to fullest potential which directly impacts student achievement and the fidelity of program implementation. Progress monitoring is a very important component of mClass: Reading 3D. Teachers progress monitor to assess students and to utilize the data to gauge whether students are growing and improving academically. Progress monitoring helps teachers determine a student’s reading performance between benchmark windows. These ongoing assessments help teachers determine the appropriate instructional level for each student throughout the year (Wireless Generation, 2013a). More professional development needs to be offered to strategically improve the progress monitoring component of mClass: Reading 3D to effectively drive instruction.

Responses to Teacher Open-Ended Survey Questions

The purpose of the open-ended questions/comments portion of the teacher survey was to obtain more extensive data. A “T-Table” has been used to display the data (see Table 10). The left side of the T-Table displayed the question or comment, and the right side showed the teacher responses.

Summary of Responses to Open-Ended Teacher Survey

Based on the collection of qualitative data, emerging themes have arisen among teachers, principals, and transformational/instructional coaches. The distinctive common themes include the responses relating to the positive impact of mClass: Reading 3D. Even though a list of choices was not provided, the groups of participants highlighted some of the same positive aspects associated with mClass: Reading 3D, which are summarized below. The data show participants indicated the programs serve as a good assessment tool for assessing a variety of skills related to reading and comprehension. Additionally, responders indicated the assessment

152
determined student reading weaknesses, based on results of student data, and helped the teacher
differentiate reading instruction in the classroom. The wealth and richness of data are strengths
of the program.

Teachers were concerned about the amount of time that it takes to fully implement all
program components such as progress monitoring. However, responses indicated that teachers
failed to make a complete connection between progress monitoring and student growth.
Teachers rated progress monitoring as the “number one” need for additional training.

Qualitative Data—Responses to Principal and Transformational/
Instructional Coach Interview Questions

Face-to-face interviews were conducted with eight administrators within the selected
school district (see Appendix I). This same process was used to collect data from five
transformation/instructional coaches from the NC Department of Public Instruction and selected
school district, According to Sipe and Constable (1996), the interpretivist attempts to describe
and understand the point of view of someone else experiencing the situation. Understanding the
subjective meaning of action can be done in an objective manner (Schwandt, 2000).

To display qualitative data from the principal and transformational/instructional coach
interviews, the researcher chose a table that would enhance visualization of concepts and ideas to
increase greater understanding. A “matrix” styled graphic organizer was selected to heighten the
researcher’s ability to seek commonalities as well as differences in responses provided to
selected questions. Responses were categorized by principals and transformational/instructional
coaches.

A separate category entitled “common themes” was listed at the bottom of each matrix.
The “common themes” category allowed the researcher to “connect the dots” to identify “bigger
broader pictures.” The ability to “drill down” into data was also greatly enhanced by the use of the matrix. Additionally, contrasting points of views and ideas of participants were highlighted in “red” to enhance the analysis of the “word” data.

Appointments were scheduled with the eight administrators who facilitated the implementation of mClass: Reading 3D at their school and the five transformational/instructional coaches. These selected educators received a consent form explaining the purpose and procedures to ensure anonymity. Once the researchers obtained consent, interviews were conducted. The following data summarized the results of the focus group interviews from the selected participants. The data was organized by question number and responses from each of the groups. Re-occurring/common themes have been noted under each question.

Question 1 of the principal and transformational/instructional coach interview focused on the Reporting and Analysis Suite that generates the vast amount of data utilized to improve student achievement. The question asked, “How do you use the reports found on the Reporting and Analysis Suite to answer the following questions?”

Which classrooms need additional instructional support?

Which categories of student academic difficulty did you find significant?

Which data/strategies do you use to show student achievement?

Both principals and transitional/instructional coaches indicated that they generate reports to track student growth, determine teacher effectiveness in the classroom, and identify which classrooms need additional supports due to areas of concern. However, principals and transformational/instructional coaches varied as to which reports they found most useful. For example, transformational/instructional coaches were much more familiar with data from the “Correlation Effectiveness Report.” On the contrary, principals were not very familiar with the
“Correlation Effectiveness Report” and rarely used it. Through questioning, it was revealed that additional training was needed in interpreting the data generated from the numerous types of reports in the reporting and analysis suite (see Figure 11).

Question 3 was a two-dimensional question that asked, “Have instructional practices changed in grades K–3 since the implementation of mClass: Reading 3D,” and “If so, how?” Principals and transformational/instructional coaches all agreed that instructional practices have changed in grades K–3 since the implementation of mClass: Reading 3D. All agreed that the changes have been positive because there has been better instructional planning, improved small group instruction and differentiation, and a heightened awareness of phonics. They also indicated that teachers are beginning to “dig deeper” into the data to effectively drive instruction. However, this remained a work in progress (see Figure 12).

Differences in responses between the principals and transformational/instructional coaches pertained to the accountability factor. Principals attributed more rigorous instruction to the connection of mClass: Reading 3D to standard six on the teacher evaluation instrument for the State of North Carolina. Standard Six rates the effectiveness of teacher performance. Principals stated there is more accountability and a sense of urgency in K–3 classrooms due to the connection to Standard Six. Transformational/instructional coaches also saw better utilization of teacher assistants in literacy centers to meet the requirements of small group instruction and differentiation.

Question 4 asked the principals and transformational/instructional coaches to describe the impact of mClass: Reading 3D on student achievement (see Figure 13). Responders stated a positive impact was being made and that teachers are now beginning to “dig deeper” into the data to drive instruction. However, transformational/instructional coaches were very concerned

*Red highlights difference in responses.*
Figure 12. Respondents’ responses as to whether instructional practices have changed in grades K–3 since the implementation of mClass: Reading 3D.
### Principals

- Beginning to see positive impact
- Teacher attitudes are getting better*
- Teachers are learning to dig deeper into student data

### Transformational/Instructional Coaches

- Positive impact, but depends on the classroom teacher and environment. Only about 2/3 teachers out of 20 are actually utilizing all components of the program with fidelity and as the program was intended. Reports show teachers are not progress monitoring at rate.
- Looking at trends and seeing students who are progress monitored at rate are making expected student growth
- Teachers are learning to dig deeper into student data

### Common Themes

- Positive impact
- Teachers are learning to dig deeper into student data

*Red highlights difference in responses.

**Figure 13.** Respondents’ beliefs about the impact of mClass: Reading 3D on student achievement.
about the lack of progress monitoring “at rate” that is occurring throughout the district. Transformational/instructional coaches indicated failure to progress monitor “at rate” may hinder a student’s ability to adequately increase according to the mClass: Reading 3D cut scores. Progress monitoring rates varied from school to school and building to building throughout the county.

Question 6 focused on the challenges to the implementation of the mClass: Reading 3D program (see Figure 14). This question was relevant to the utilization of data to drive instruction because transitional/instructional coaches identified time management as the reason why progress monitoring “at rate” is low in the school district. Teacher surveys also revealed that there is not enough time for progress monitoring.

Common themes that surfaced were the high percentage of teachers who transition to different schools or grade levels throughout the year. This may cause a stability problem at the school. Also, lack of on-going staff development to keep everyone informed was a concern. Everyone agreed that the train the trainer (TOT) has not worked effectively. Finally, principals and transformational/instructional coaches noted a need for literacy/reading coaches to improve program implementation and fidelity as well as teacher support.

Question 7 asked, “What recommendations do you have for improvements to mClass: Reading 3D?” (see Figure 15). Many answers were provided by principals and transformational/instructional coaches as it relates to recommendations that directly impact the utilization of data to drive instruction. For example, the coaches recommended improving the Now What? Tools to a show “scope and sequence” of instruction to assist teachers. There was a common consensus among the coaches that the “Now What? Tools” were too vague and needed to be more informative when prescribing instruction tailored to meet individual student needs.
### Principals
- Transition of teachers
- Lack of on-going and effective training
- Lack of instructional coaches
- Train the Trainer model not effective at every school
- Technology issues with syncing, slow systems, and late emails about problems

### Transformational/Instructional Coaches
- Transition of teachers
- Lack of on-going and effective training
- Lack of instructional coaches
- Train the Trainer model not effective at every school
- Time management
- Progress monitoring at rate in low performing school (not enough time)

### Common Themes
- Transition of teachers
- Lack of on-going and effective training
- Lack of instructional coaches
- Train the Trainer model not effective at every school

*Red highlights difference in response*
Re-examining the benchmark window at the beginning of the year would help impact instruction as it allows more time for students to transition into the school year especially in kindergarten where maturity poses a problem. Next, transformational/instructional coaches stated there is a need to re-examine the number of levels students are to master each year to maintain adequate academic growth. The number of levels a student is required to master is different for each grade level causing possible discrepancies and achievement gaps.

Question 11 asked the participants to select their preference for the type of additional training and/or support they felt would be beneficial in the future. Participants were allowed to choose a maximum of three responses to rank in order of preference (see Figure 16). “Benchmark and/or progress monitoring data to inform instruction” was ranked as the most beneficial training needed in the future by principals and transformational/instructional coaches. The second most beneficial training reported by participants was “Reporting and Analysis Suite for school & district administrators only.” Answers varied among principals and transformational/instructional coaches for the third most beneficial training needed in the future. Principals indicated that more training was needed for benchmark and/or progress monitoring for school and district administrators. Transformational/instructional coaches noted a need for future training on the Now What? Tools.

**Summary of Principals’ and Transformational/Instructional Coaches’ Interviews**

The principal and transformational/instructional coach interviews detailed much useful information concerning utilizing data to drive instruction. Insight as to how principals and transformational/instructional coaches generated data to actually gauge whether teachers are effectively utilizing data to drive instruction was particularly interesting. Transformational/instructional coaches were better trained in the reporting and analysis suite.
**Figure 16.** Respondents’ preferences for the type of additional training and/or support they feel would be beneficial for future training on the Now What? Tools.

The coaches had a better understanding of interpreting the various types of charts to aid teachers in the utilization of data to drive instruction.

The progress monitoring with fidelity report was a popular tool among participants. All parties generated this report to assess whether teachers are progress monitoring as the program intended. Progress monitoring helps teachers determine a student’s reading performance between benchmark windows. These ongoing assessments help teachers determine the appropriate instructional level for each student throughout the year. Failure to progress monitor at rate greatly impacts student reading growth and creates fidelity issues with implementation. Data revealed that students are not being progress monitored as specified by mClass: Reading 3D. Amplify (2011a) recommends that students color coded as red (far below proficient) be progress monitored every two weeks and students color coded as yellow (below proficient) be progress monitored every four weeks. Meanwhile, students color coded as green (proficient) or blue (above proficient) need to be progress monitored every nine weeks. Based on their observations, transitional/instructional coaches stated that only two or three teachers out of twenty are actually progress monitoring “at rate”. Clearly, there is a need for more training and understanding of program components to aid in better utilization and program fidelity.

Quantitative Data—2012-2013 mClass: Reading 3D

Second-Grade Assessment Results

The second phase of the research study was based on quantitative data. mClass: Reading 3D data for students enrolled in second grade during the 2012–2013 school was obtained upon approval for the selected district. The Beginning of the Year (BOY) data was compared to the End of Year (EOY) data. Additionally, data was analyzed to determine to what extent, if any, mClass: Reading 3D has impacted students’ reading achievement in second grade.
The three participating rural elementary schools were selected through a purposeful (Patton, 1990) or criterion-based (LeCompte & Preissle, 1993) sampling procedure. Purposeful sampling allows the researcher to gain the most insight by using specific criteria which “directly reflect the purpose of the study and guide in the identification of information rich cases” (Merriam, 1998, pp. 62–63). According to Patton (1990), “Information rich cases are those from which one can learn a great deal about issues of central importance to the purpose of the research, thus the term purposeful sampling” (p. 169).

The purposeful or criterion-based sample included the following criteria: a rural public elementary school in the State of North Carolina that implemented the mClass: Reading 3D program during the 2010/2011 school year, with each racial/ethnic group representative of the community and school district. The three elementary schools included enrollment with 40% or more economically disadvantaged, meeting federal guidelines for a Title I Part A funding to meet the learning needs of all students (U.S. Department of Education, n.d.).

The collected quantitative data was received from the testing coordinator of the selected school district with the approval of the Assistant Superintendent of Curriculum and Instruction. Figures 17–19 show the performance of levels of second grade students at the beginning-of-year (BOY), middle-of-year (MOY), and end-of-year (EOY) benchmarking periods.

Summary

Based on the collection of mClass: Reading 3D data from the three selected schools, the number of second-grade students scoring “well below benchmark” and “below benchmark” increased from the BOY to the EOY. Therefore, after two years of implementation, test results revealed that mClass: Reading 3D did not have a positive impact on student reading achievement. However, on a positive note, two of the three schools (Sycamore Lane Elementary
Note. The graph shows the number of students enrolled during each benchmarking period. At the BOY, a total of 97 second grade students were tested using the mClass: Reading 3D assessment. Twenty students (21%) scored well below benchmark, 10 students (10%) were below benchmark, and 67 students (69%) scored at the benchmark rate. At the EOY, a total of 95 second grade students were tested. Twenty three students (24%) scored well below benchmark, 16 students (17%) were below benchmark, and 56 (59%) were at benchmark rate.

Figure 17. 2012–2013 mClass: Reading 3D composite scores for second-grade students at Forest Lane Elementary School.
Note. The graph shows the number of students enrolled during each benchmarking period. At the BOY, a total of 49 second grade students were tested using the mClass: Reading 3D assessment. Twelve (24%) scored well below benchmark, 10 students (20%) were below benchmark, and 27 students (56%) scored at the benchmark rate. At the EOY, a total of 56 second grade students were tested. Fourteen students (25%) scored well below benchmark, 11 students (20%) were below benchmark, and 31 (55%) were at benchmark rate.

Figure 18. 2012–2013 mClass: Reading 3D composite scores for second-grade students at Sycamore Lane Elementary School.
Note. The graph shows the number of students enrolled during each benchmarking period. At the BOY, a total of 54 second grade students were tested using the mClass: Reading 3D assessment. Fifteen (28%) scored well below benchmark, 12 students (22%) were below benchmark, and 27 students (50%) scored at the benchmark rate. At the EOY, a total of 64 second grade students were tested. Seventeen students (27%) scored well below benchmark, 14 students (22%) were below benchmark, and 33 (51%) were at benchmark rate.

Figure 19. 2012–2013 mClass: Reading 3D composite scores for second-grade students at Pine Brook Elementary School.
and Pine Brook Elementary School) increased the number of students at the benchmark rate from the BOY to the EOY (see Figures 18 and 19). Sycamore Lane Elementary increased the number of student proficiency from 27 to 31. Pine Brook Elementary increased the number of student proficiency from 27 students to 33. During this time of implementation, the train-the-trainer model was used for staff development. The results of the quantitative data may be attributed to fidelity issues associated with progress monitoring and benchmark administration. Since 2012–2013, an emphasis has been placed on consistency of benchmark administration, progress monitoring at rate, and the use of results to drive reading instruction. The researcher noted these scores were generated prior to the connection of mClass: Reading 3D scores to Standard 6 and the Read to Achieve state mandate; thus, placing a sense of urgency throughout the K-2 classrooms. Furthermore, as noted in the qualitative data, teachers, principals, and transformational/instructional coaches have seen an improvement in the classroom reading instruction and have begun to use reports to show the positive impact mClass: Reading 3D is now having on student reading achievement.

**Findings**

The purpose of this study was to explore the relationship that exists between the history of reading instruction, the impact of mClass: Reading 3D on student achievement in second grade, and the impact of quality professional development through a program evaluation. Data from this study will be used to inform the implementation process of mClass: Reading 3D to positively impact on students’ reading achievement. Specifically, the study addressed the following question:

*To what extent, if any, do teachers use student data to determine instructional practices that may impact student achievement?*
Teacher Survey Finding 1

Based on the results from teacher surveys, several common themes emerged as it relates to the question “To what extent, if any, do teachers use student data to determine instructional practices that may impact student achievement?” The data revealed that teachers do utilize mClass Reading 3D data to drive instruction. However, data usage to modify instruction varied greatly among teachers. The highest number of teachers (48%) responded that data was used “weekly” to modify instruction (see Figure 6).

The same findings also applied when survey Question 10 asked teachers, “How frequent is progress monitoring data used for setting student goals?” (see Figure 8). Responses indicated that 45% of teachers (19 out of 42) utilized progress monitoring data for setting student goals on a “weekly” basis. Interestingly, the same percentage (45%) of teachers (19 out of 42) indicated they used the data “monthly” to set student goals. Seven percent of the teachers (3 out of 42) responded that they used progress monitoring data daily to guide instruction. In contrast, one responder revealed that he/she “never” used the data to set student goals.

The findings lead the researcher to question whether teachers have been provided with training on how to “effectively” utilize data to drive instruction on a consistent basis. In other words, teachers need to be able to identify how instruction “looks” when student data are utilized to determine instructional practices that may impact student achievement.

In reality, the importance of literacy cannot be overstated (Snow et al., 1998). Learning to read is one of the most important abilities a student can acquire (Kirk, 1999; Reitzhammer, 1990). Students who do not learn to read as expected are less likely to complete high school (Morris et al., 1990; Reitzhammer, 1990; Shanahan & Barr, 1995). If data are not utilized on a daily basis, how much differentiation and personalization actually exists to meet specific needs
of students? Better utilization of data to drive instruction needs to take place in order for student deficiencies to be properly diagnosed to improve reading achievement.

**Teacher Survey Finding 2**

Another finding from the question surveys highlighted the positive attitude teachers have toward mClass: Reading 3D, the program components, and its impact on student reading achievement. Survey Question 11 asked, “How would you rate the impact of assessment and data to drive instruction at your school?” (see Figure 9). Eighty-three percent of the teachers (35 out of 43) felt that utilizing assessment and data to drive instruction had a somewhat positive to positive impact at the school.

Additionally, Survey Question 16 asked responders to rate their overall satisfaction with the implementation of mClass: Reading 3D with components relating to program requirements, resources, and technology (see Figure 10). The survey choices allowed responders to rate identified components on a scale with four ratings: negative impact, somewhat negative impact, somewhat positive impact, or positive impact. The data showed that 23 out of 43 responders (54%) felt that mClass: Reading 3D had a somewhat positive impact as it relates to the clarity of the NC assessment administration schedule for benchmarking. Fifty-one percent of teachers (22 out of 43) scored the promptness in receiving assessment results as having a positive impact on the implementation of mClass: Reading 3D. Twenty-seven out of 42 responders (64%) rated using and interpreting the assessment results as having a “somewhat positive impact” on the implementation of mClass: Reading 3D. The data consistently revealed a higher percentage of positive responses in comparison to negative responses.

The findings supported various research conducted on 21st Century Learning and technology. The use of technology can be an effective support tool in differentiating reading
instruction by (a) presenting information and activities to students, (b) assessing students’ work, and (c) being a scaffold or support to reading successfully (Leu, 2000). In 2000, the National Reading Panel issued a report on effective, research-based reading instruction. The panel concluded that effective reading instruction implements phonemic awareness, phonics, fluency, vocabulary and text comprehension. Teachers who are knowledgeable and effective cannot be replaced with technology. However, technology can be used to support students struggling in the above mentioned areas (Leu, 2000).

**Principal and Transformational/Instructional Coaches Interview Finding 1**

Based on results from the interview/questionnaire, mClass: Reading 3D has impacted how teachers utilize student data to determine instructional practices to improve student achievement. Question 3 from the principal and transformational/instructional coaches interview was a two-dimensional question that asked, “Have instructional practices changed in grades K–3 since the implementation of mClass: Reading 3D,” and “If so, how?” Principals and transformational/instructional coaches all agreed that instructional practices have changed in grades K–3 since the implementation of mClass: Reading 3D. All agree that the changes have been positive because there have been better instructional planning, better small group instruction and differentiation, and a heightened awareness of phonics. They also indicated that teachers are beginning to “dig deeper” into the data to effectively drive instruction. However, this remained a work in progress (see Figure 12).

The decline in third-grade North Carolina End-of-Grade reading scores has placed an increased emphasis on improving reading achievement of students in grades kindergarten through second. These diminishing student achievement scores, based on state standardized achievement tests, have resulted in a sense of urgency for public school districts in North
Carolina to implement a diagnostic reading assessment program to improve student performance (NC School Report Card, 2013). mClass: Reading 3D has provided more alignment and a clearer picture for individualizing instruction and meeting student needs. The two assessment tools, DIBELS Next and Text Reading and Comprehension (TRC), combine information to provide teachers with each student’s instructional reading level (Collaborative Center for Literacy Development, 2013).

**Principal and Transformational/Instructional Coaches Interview Finding 2**

Though mClass: Reading 3D is viewed favorably among participating principals and transformational/instructional coaches, findings revealed areas of concern for program improvement. The interviews revealed that additional training was needed for interpreting the data generated from the numerous types of reports in reporting and analysis suite (see Figure 11). Also, all principals and transformational/instructional coaches agreed that the train-the-trainer (TOT) has not worked to effectively implement mClass: Reading 3D due to various levels of educational backgrounds and expertise. All participants noted a need for effective instructional/literacy coaches to be placed in all schools to improve program implementation and fidelity as well as teacher support (see Figure 16). Finally, there is a need to eliminate the mClass: Reading 3D program as a mandate for third grade classrooms. mClass: Reading 3D is better suited for K–2 classrooms. Third grade assessment needed to focus on EOG objectives and standards to eliminate the possibility of over assessing and burn-out on both students and teachers.

The areas of concern highlighted by principals and transformational/instructional coaches are supported by research. Deficiency in reading achievement starts early and accelerates over the course of a student’s school experience (Keiser, 2011). Reading expectations increase as
students leave elementary school and enter middle grades where they will face complex content-based informational texts. If teachers do not intervene and diagnose reading deficiencies early and appropriately, students who enter middle school as unsteady readers have a greater chance of becoming struggling readers (Sturtevant, 2003).

Since the passage of the No Child Left Behind Act in 2001, more and more states have implemented statewide assessments. This act included a requirement that all children would be proficient in reading and mathematics by the 2013–2014 school year (U.S. Department of Education, 2010c). Obviously this requirement was not achieved. Mandates, such as the No Child Left Behind Act in 2001, are a prime example of why there is need to listen to the concerns of educators at different capacities in an effort to meet student performance and satisfy ever-increasing mandates.

**Student Assessment Results—Finding 1**

This study analyzed second-grade data from three schools with similar demographics to determine to what extent, if any, teachers use data to determine instructional practices. Based on the results of mClass: Reading 3D data from the three selected schools, the number of second-grade students scoring well below benchmark (red) and below benchmark (yellow) increased from the BOY to the EOY during the 2012–2013 school year. These data were generated two years after implementation of mClass: Reading 3D at these selected schools. Test results indicated that mClass: Reading 3D did not have a positive impact on the number of students achieving grade level proficiency in reading at the end of the year. The data actually showed an “increase” in the number of students “failing” to read on grade level from the beginning of the year to the end of the year at all three schools (see Figures 17–19).
Based on the data collected by the researcher from teachers, principals, and transformational/instructional coaches, the increase in the number of students not achieving proficiency may be attributed to progress monitoring and fidelity issues. Some researchers agreed that educators should not assume that just because a program is adopted, it will be implemented as intended (Desimone, 2002; Klein & Sorra, 1996; Mills & Ragan, 2000). Educators adopt programs and without further research, assume that it will yield positive results. Klein and Sorra (1996) echoed, “Implementation is the critical gateway between the decision to adopt the innovation and the routine use of the innovation within an organization” (p. 1,057). In order to yield expected results, implementers must ensure that the program has been implemented with fidelity.

**Student Assessment Results—Finding 2**

On a positive note, two of the three schools (Sycamore Lane Elementary and Pine Brook Elementary School) produced more students at the benchmark proficiency (green) from the BOY to the EOY. Sycamore Lane identified 27 students at proficiency (green) during the BOY. This number increased to 31 students at proficiency (green) during the EOY. Pine Brook Elementary identified 17 students at proficiency (green) during the BOY. This number increased to 33 proficient students (green) during the EOY (see Figures 18 and 19). Forest Lane Elementary was the only school that did not increase the number of students achieving benchmark proficiency (green) from the BOY to the EOY. Figure 17 revealed that 67 students achieving benchmark proficiency (green) during the BOY. The number proficiency (green) was reduced to 56 during the EOY, indicating a negative impact. Due to the research conducted by the Annie E. Casey Foundation, elementary schools should be very concerned about low student reading achievement scores as it relates to future academic success. The Annie E. Casey Foundation
states that if trends hold true, 6.6 million low-income children currently in the birth to 8 age

group are at increased risk of failing to graduate from high school on time because they will not

be able to meet the proficient reading level of the National Assessment of Educational Progress

(NAEP) by the end of third grade (Annie E. Casey Foundation, 2013a).

Conclusions

The purpose of this study was to explore the relationship that exists between the history

of reading instruction, the impact of mClass: Reading 3D on student achievement in second

grade, and the impact of quality professional development through a program evaluation. Data

from this study were used to inform the implementation process of mClass: Reading 3D that may

have a positive impact on students’ reading achievement. Specifically, the study attempted to

address the following question:

To what extent, if any, do teachers use student data to determine instructional practices

that may impact student achievement?

1. Based on teacher survey responses, there was a lack of consistency on how often the

mClass: Reading 3D data are used to modify student instruction (see Figure 6).

Forty-eight percent of responders (20 out of 42) used the data to modify student

instruction on a weekly basis, whereas 31% of responders (13 out of 42) used the data

to modify instruction on a monthly basis. Only 19% (8 out of 42) used the data for

modification of student instruction on a daily basis, and 2% (1 out of 42) never used

the data to modify student instruction. This indicated that students are not being

progress monitored “at rate” in many classrooms according to the program

specifications to improve student growth. Therefore, mClass: Reading 3D has not

been implemented with fidelity. Teachers and administrators often implement
programs and are disappointed with the results, assuming the program was flawed. However, in many cases, once an evaluation of a program initiative is completed, they realize it may simply be the implementation process that was flawed (Pressman & Wildavsky, 1984). There is a need to monitor programs after implementation to ensure overall validity and success of the program.

2. Varying results were displayed in Question 10 pertaining to progress monitoring. When teachers were asked, “How frequent is progress monitoring data used for setting student goals?” The teacher responses were heavily split between “weekly” and “monthly” responses (see Figure 8). Responses indicated that 45% of teachers (19 out of 42) utilized progress monitoring data for setting student goals on a “weekly” basis. Interestingly, the same percentage (45%) of teachers (19 out of 42) indicated they used the data “monthly” to set student goals. Seven percent of the teachers (3 out of 42) responded that they used the progress monitoring data “daily” to guide instruction, while one responder never used the data to set student goals.

The administration of benchmark assessments and progress monitoring helps teachers determine the strengths and weaknesses of skills accessed to inform instruction. It is mandated that students be assessed to measure progress, diagnose difficulties, and inform instruction and remediation needs (NCDPI, 2012). Along with the beginning of year (BOY), middle of year (MOY), and end of year (EOY) assessments, progress monitoring assessments must be given between each benchmark according to the state progress monitoring schedule. The policy included teacher and administrator responsibilities to analyze assessment data results and modify instructional practices to meet the individual needs of students. The data revealed that there is a
miscommunication between what is “mandated” by the state and what is actually occurring in the classrooms as far as benchmarking and progress monitoring is concerned.

As a principal of a school, it is alarming to learn that for the last four years, teachers and administrators have used mClass: Reading 3D data to conduct parent conferences, guide PLCs, and determine student instruction, promotion, and retention based on data containing program fidelity issues. To add further “insult to injury”, the State of North Carolina has also rated teacher and administrator effectiveness (Standards Six and Eight) from data generated from a program implemented with fidelity issues. Hopefully the results of this study revealed the need for implementation of any program with fidelity. Better monitoring, communication, and professional development must exist to achieve reliable and valid results. Though 2012–2013 test results showed a negative impact on student achievement, the true impact of mClass: Reading 3D remains undetermined as it relates to using student data to determine instructional practices that may impact student achievement.

3. According to responses from principals and transformational/instructional coaches, progress monitoring at rate and fidelity remains a concern in elementary schools implementing mClass: Reading 3D across the State of North Carolina. Principal and transformational/instructional coaches see a direct link to student achievement and teachers who progress monitor “at rate”. Teachers who progress monitor “at rate” and with fidelity are improving and growing students at an acceptable rate (see Figure 13).

Data from benchmarks give teachers precise information to provide personalized interventions, extend help to individual students, and assign students to work in flexible collaborative groups that can change as students progress at different rates or redirect their
learning focus. Several researchers have found that the digital environment allows a collection of students and talents to come together with an enhanced impact on learning. Thomas and Brown (2011), in *A New Culture of Learning*, say that learning communities facilitated by technology allow students—both individuals and groups—to deepen and broaden their conceptual understanding of curriculum topics. Also, valuable information is provided about the targeted population, program activities, and the overall validity and success of the program (Allington & Gabriel, 2012).

4. Results from Survey Question 11 showed 48% of teachers (20 out of 42) rated the impact of assessment and data to drive instruction at their school as “somewhat positive”, whereas 36% (15 out of 42) rated the impact as “positive” (see Figure 9). Nine percent of teachers (4 out of 24) rated the impact of mClass: Reading 3D and utilization of data to drive instruction as a “somewhat negative”, while 7% of teachers (3 out of 42) gave a negative rating.

Although 83% of teachers rated the impact of assessment and data to drive instruction at their school as “somewhat positive” to “positive”, principals and transformational/instructional coaches reported that only 2 to 3 out of 20 teachers (15% to 20%) are effectively utilizing the data with fidelity to drive instruction to improve student reading achievement. These results indicated that teacher perceptions on how to “effectively” utilize data with fidelity to drive instruction differed greatly from those of principals and transformational/instructional coaches. There is a need for teachers, principals, and transformational/instructional coaches to share the same views and understandings on how to effectively utilize the data “with fidelity” to drive instruction to improve student achievement.
5. From the data generated from teachers, principals, and transformational/instructional coaches, responses showed mClass: Reading 3D data has impacted teacher instruction in the classroom. Question 9 from the teacher survey asked the following, “How do you use your data to drive instruction?” Choices were provided that included “all of the above” and “none of the above” responses. Teachers were also allowed to specify and give other answers that were not in the provided list (see Figure 7). The most popular choices among responders were small group instruction, differentiating instruction, and parent conference. Seventy-four percent of responders (31 out of 42) chose small group instruction, while 67% of responders (28 out of 42) selected differentiating instruction.

6. Principals and transformational/instructional coaches all agreed that instructional practices have changed in grades K–3 since the implementation of mClass: Reading 3D. All agreed that the changes have been positive because there have been better instructional planning, better small group instruction and differentiation, and a heightened awareness of phonics. They also indicated that teachers are beginning to “dig deeper” into the data to effectively drive instruction. However, this remained a work in progress (see Figure 12).

These results supported much of the research that revealed how technology has led to vast improvements in formative assessments. Formative assessment (Assessment for Learning) is the most important type of assessment done in the classroom. Formative assessment is an active and intentional learning process that includes the teacher and the student continuously and systematically gathering evidence of learning with the ultimate goal of improving student
achievement (Moss & Brookhart, 2009). The process of helping students move forward from their present learning state to their expected learning goal.

Thomas R. Guskey suggests that for assessments to become an integral part of the instructional process, teachers need to change their approach in three important ways. They must “1) use assessments as sources of information for both students and teachers, 2) follow assessments with high-quality corrective instruction, and 3) give students second chances to demonstrate success” (Guskey, 2007, p. 107). Assessments in schools are a necessity. Assessing students’ learning takes time and in some cases creates anxiety for both teachers and students.

7. Another conclusion drawn for the collected data from all parties involved was the need for reading specialists at every school to improve the implementation of mClass: Reading 3D. Principals and transformational/instructional coaches indicated a strong need for a highly trained and effective reading coach in every elementary school to implement mClass: Reading 3D (see Figure 15). The reading coach would help facilitate the implementation process, improve issues with fidelity, and support teachers to increase student achievement. This conclusion can be generalized to other districts in the State of North Carolina with similar student achievement.

8. Due to the North Carolina End of Grade Reading Test and the Read to Achieve requirements, teachers, principals, and transformational/instructional coaches saw the need to remove mClass: Reading 3D from third-grade classrooms (see Table 10 and Figure 15). Research has always supported the importance of students being able to read proficiently by the end of third grade. Reading proficiently by the end of third grade is a crucial marker in a child’s educational development. Failure to read
proficiently is linked to higher rates of school dropout, which suppresses individual earning potential as well as the nation’s competitiveness and general productivity (Annie E. Casey Foundation, 2013a). By third grade, students are expected to know the fundamentals of reading and be able to apply their reading skills across the curriculum. Students are no longer being taught how to read in third grade. Instead, teachers use written text to teach other material such as social studies, science, and mathematics. Shifting from “learning to read” to “reading to learn” is very difficult for students who have not mastered basic reading skills. As they progress in age, struggling readers find themselves exposed to more and more complicated types of text.

With increased expectations of accountability for student success (Bailey, 2002), schools are faced with finding alternative methods to improve student achievement. Teachers in third grade have been inundated with so many mandates from Read to Achieve, Race to the Top, EOG, mClass: Reading 3D, and other programs. So many requirements in one grade level can do more harm than good to both students and teachers.

9. Lastly, principal and transformational/instructional coaches saw the need for every K–3 teacher to receive staff development on “Reading Foundations” to be properly trained in the understanding and teaching of phonics and phonemic awareness (see Figure 15). Based on the interview data, teachers have become more aware of the importance of phonics when teaching students to read. English Language Arts classes are more structured and focused with the implementation of literacy centers, small group instruction, differentiation, and less dependency on the basal. However,
principals and transformational/instructional coaches feel new teachers need a stronger knowledge base in the phonics and phonemic awareness instruction.

The National Reading Panel (2000) stated that phonemes are the smallest units composing spoken language. For example, the words “go” and “she” each consists of two sounds, or phonemes. Instruction in phonemic awareness involves teaching children to focus on and manipulate phonemes in spoken syllables and words. Overall, the findings showed that teaching children to manipulate phonemes in words was highly effective under a variety of teaching conditions with a variety of learners across a range of grade and age levels. Teaching phonemic awareness to children significantly improves their reading more than instruction that lacks any attention to phonemic awareness (National Reading Panel, 2000).

Based on these conclusions, there is a need for the State of North Carolina to understand the seriousness of fidelity issues on elementary schools that have implemented mClass: Reading 3D. Unless a program is properly implemented, according to guidelines and standards, the data generated from progress monitoring and benchmarking results are unreliable and invalid.

After much reflection on the highlighted conclusions, a question continuously surfaced connecting the study to my role as a school administrator. “How does this study impact me, as a school leader, to help teachers use student data to determine instructional practices that may impact student achievement” is a question that has frequented my thoughts throughout the entire process. Administrators can never make the following assumptions:

• The state department and boards of education are responsible for the implementation of the mandated programs at the school level. This is not true. The leader of a school can never make the mistake of leaving such implementations solely up other agencies when it involves student achievement. Principals have to take ownership in all
initiatives at the school level and be prepared “to pick up the ball when someone drops it.” This includes providing additional staff development to address areas of concern and becoming familiar with program components as required with teachers and specialists. Leaders have to know the “nuts and bolts” of implemented programs to identify and diagnose implementation problems in early stages.

- The test results will inform program worth and value. This is not necessarily true. If a program is not implemented with fidelity as intended by specified guidelines, then how can program’s worth and value be determined? So many variables impact the validity and reliability of test scores beyond that of student knowledge. One must consider staff development, communication, monitoring, technology, attitude, skill level, and many other variables.

- One program is the “fix all” to student achievement. This is not true of any program. With this in mind, it is important to equip teachers with a strong set of foundational skills needed to effectively teach reading to any assigned student regardless of the program implemented. However, administrators need to help teachers learn to embrace data generated by programs such as mClass: Reading 3D. Teachers need to understand how to “drill down” into data to form instruction for individualized instruction. Educators can never cut corners when it pertains to student achievement. Too much is at stake such as student promotion and retention, as well as, accountability measures placed on educators.

In conclusion, the future of mClass: Reading 3D remains uncertain as there is already the possibility of another program implementation taking place in the near future. As history has frequently shown, the full impact of programs is never completely determined due to short
duration periods in the classroom. Programs are quickly replaced by other programs before answers concerning the impact can truly be answered. The researcher of this study feels there is a need to address the concerns and issues associated with mClass: Reading 3D and continue implementation of the program with fidelity. This is necessary in order to adequately answer the question, “To what extent, if any, do teachers use student data to determine instructional practices that may impact student achievement?”

**Practical Recommendations**

The purpose of this study was to explore the relationship that exists between the history of reading instruction, the impact of mClass: Reading 3D on student achievement in second grade, and the impact of quality professional development through a program evaluation. Data from this study will be used to inform the implementation process of mClass: Reading 3D that may have a positive impact on students’ reading achievement. Specifically, the study attempted to address the following question:

*To what extent, if any, do teachers use student data to determine instructional practices that may impact student achievement?*

**Address Fidelity Issues**

Existing fidelity issues associated with progress monitoring and benchmarking must be addressed among all educators in the selected school district. Failure to do so will negatively impact student scores. Students will suffer as a result of inaccurate reading scores derived from improper progress monitoring and benchmarking results that do not accurately depict their current levels, performances, or capabilities. Schools cannot afford to make important decisions, such as student retention and teacher effectiveness, from invalid and unreliable data generated from improper implementation. Consider the following questions. Is it ethical to retain a child
based on data generated from a teacher who did not progress monitor the student at all?  Is it ethical to rate a teacher, who was not properly trained about program components, as “below standard” based on mClass: Reading 3D test results?

Failure to address fidelity issues can have serious consequences. Teachers may fail to meet student needs as a result of skewed data generated from improper progress monitoring and benchmarking data. Teachers may also fail to properly diagnose and prescribe instruction for individual students. Principals and transformational/instructional coaches may fail to adequately determine teacher effectiveness and student achievement as a result of fidelity issues associated with progress monitoring and benchmarking. The school system may fail as a result of poor student achievement scores generated from fidelity and implementation issues. As a result, the following are suggestions to improve program implementation and fidelity.

• First of all, teachers have to know when, how, and how much to progress monitor and benchmark. It cannot be a guessing game. Teachers seem to have the desire and passion, but lack the proper understanding and training. It is imperative that teachers understand how to progress monitor “at rate.” The survey data collected from teachers indicated that teacher responses varied in the frequency of progress monitoring in classrooms in the three selected schools. Teachers did not seem to understand what was “acceptable practice” concerning program implementation. Therefore, there is a need for ongoing and continuous staff development to address issues to improve consistency and implementation district-wide.

• Principals have to do a better job of monitoring student and teacher data. Principal interviews showed a lack of understanding and training about the various reports and data able to be generated from mClass: Reading 3D. Principals have to be properly
trained so they know how to “drill down” to obtain reports for mastery of skills, student performance, and teacher effectiveness. Some of the statements made by principals such as “I not familiar with that report” or “I have not utilized that report before” were concerning and needed to be addressed. Principals need to possess a knowledge level equal to that of the transformational/instructional coaches as it pertains to mClass: Reading 3D. These issues can only be addressed with proper training that is continuous and ongoing.

**Implement Literacy Coaches for All**

Transformational/instructional coaches seemed to be quite knowledgeable about all program components and usability. The concern with transformational/instructional coaches is there are not enough of them placed at schools to share their expertise. This is indicative of inequality in education. With the heavy amount of accountability placed on student performance, every elementary school implementing mClass: Reading 3D should be provided a literacy specialist to increase fidelity, support teachers, and facilitate the entire implementation process. This is not the case at many schools throughout North Carolina.

Administrators are “instructional leaders” at schools. However, this is not the only title assigned to principals throughout the day. School environments have become complex organizations that deal with legal issues on a daily basis associated with safety concerns, discipline, media attention and scrutiny, parent complaints, testing/accountability, social services, medical needs, technology difficulties, audits, and endless amounts of paperwork and meetings. On many days, principals simply do not get to visit classrooms to adequately monitor instruction due to handling crises and situations needing immediate attention. Therefore, there is a need for every school to have a literacy specialist who spends the day truly providing teacher
support, addressing curriculum concerns, and facilitating program implementation. An effective literacy specialist has the potential to create an environment filled with transparency of curriculum alignment and expectations between all parties involved in the implementation of mClass: Reading 3D. Hopefully this will translate to better understanding and instruction to increase student achievement.

**Improve Quality Professional Development**

Based on data collected from principal and transformational/instructional coach interviews, a “refresher” training should be provided at the beginning of the school year to K–3 teachers implementing mClass: Reading 3D (see Appendix I). This staff development should provide updates, reviews, and transparency to ensure fidelity throughout the school year.

Also, data indicated that K–3 teachers need additional in-depth training on benchmark assessment, and progress monitoring annually to increase fidelity and program implementation. Based on data collected from principals and transformational/instructional coaches, this training should not be conducted using the Train-the-Trainer (TOT) model. A program of this magnitude and importance should always be implemented by transformational/instructional coaches, literacy specialists, and others on a comparative level to ensure the components are implemented as intended. Never has the importance of quality professional development been of greater importance than today. Educational reforms and plans everywhere are constantly emphasizing the need for high quality professional development. Guskey (2000) identifies four reasons for the growing interest in professional development. The first is that educators have a better understanding of the dynamic nature of professional development. No longer can professional development be seen as “something done to educators” for three or four days during the school year.
Principals and transformational/instructional coaches indicated a need for required “Reading Foundations” training for K–3 teachers and principals implementing mClass: Reading 3D. The training will equip educators with a strong foundation of teaching of phonics and phonemic awareness. Pinnell and Fountas (2006) placed emphasis on the student developing habits of a reader while teachers offer skills-based instruction that good readers are able to master. This includes the use of phonics knowledge and skills to decode and comprehension strategies to make meaning. In order for students to become proficient, lifelong readers, they need the following instructional activities:

- time to read,
- access to books that match their reading ability and interest,
- time for experiences with making words,
- authentic exposure to phonemic awareness and phonics activities

**Improve University and School Collaboration**

School leaders across the State of North Carolina noted a concern with the hire of new teachers who lack a strong foundation and understanding of the teaching of phonics, phonemic awareness, and how to teach reading (see Appendix I). A teacher who does not have a clear understanding of phonics, phonemes, and phonemic awareness will not deliver quality instruction which will impact student learning regardless of the program implementation. The IRA (2004) stated that the appearance and design of a balanced literacy approach may vary according to implementation, but there are several key components that must be present. It is a multi-layered instructional approach that includes the following:

- extensive authentic reading and writing,
- use of semantic and syntactic contextual cues,
• self-monitoring and self-regulation, and
• practice in reading with fluency, speed, and accuracy (IRA, 2004).

Therefore, the public school districts and local universities must collaborate to better equip new teachers with necessary skills that will enable them to deliver effective phonics and phonemic instruction on day one of their career. This will only take place through collaboration and communication efforts as well as transparency of initiatives and concerns.

**Remove Third-Grade Students from mClass: Reading 3D**

A high emphasis has been placed on K–3 teachers to prepare students to read proficiently by the end of third grade (Race to the Top, 2013). Inundated with the Read to Achieve requirements, mClass: Reading 3D requirements, and the North Carolina End of Grade Test, third-grade teachers are tirelessly trying to meet the demands of the huge requirements placed on one grade level. Meeting so many requirements has become virtuously impossible for third-grade teachers. The state department does not seem to understand the difficulty of monitoring reading growth and achievement from different tests that are not administered in the same fashion or based on the same components. In short, the EOG Test and mClass: Reading 3D Assessment are not aligned with the same format, features, requirements, or objectives.

The responsibilities of third-grade teachers are overwhelming. For example, third-grade teachers have to worry about the EOG pretest and posttest, as well as the EOG benchmarks administered throughout the school year. Additionally, third-grade teachers have to administer the BOY, MOY, and EOY benchmark tests as part of mClass: Reading 3D. This also includes the progress monitoring that must occur on a daily basis between BOY, MOY, and EOY assessments.
According to interviews from principals and transformational/instructional coaches, third grade has become the grade level that no one wants to teach in elementary schools due to the heavy demands of testing and assessment. Based on collected data from surveys and interviews, it is recommended that the mClass: Reading 3D assessment be removed from third grade. Since third-grade teacher “effectiveness” is determined from EOG data for the standard six evaluation component, the focus should remain on mastering the EOG test.

**Recommendations for Future Research**

Based on the collection of data in the study, the mClass: Reading 3D assessment has provided rich data to guide teachers to improve student reading achievement. Problems of concern have been identified and discussed; however, as shown in other mClass: Reading 3D research (M. T. Wilson, 2012), steps need to be taken to utilize the data to its fullest potential to differentiate and drive instruction, improve fidelity in the implementation of the program, and to improve student reading achievement. Further research needs to be conducted to determine the impact, if any, of reading instructional coaches on the implementation of mClass: Reading 3D. Some schools throughout the State of North Carolina have literacy/reading specialists while others do not. The reasons for this are attributed to funding, test scores, and local boards of education. However, further research needs to be conducted to determine the impact of mClass: Reading 3D in schools that have literacy/instructional specialists in comparison to schools that do not. Additionally, other areas need to be explored that relate to program fidelity, transparency, alignment among teachers and administrators, quality staff development, and teacher support.

Results from this study can be generalized to other rural school districts in the State of North Carolina that are implementing mClass: Reading 3D in grades K–3. However, future
studies need to be completed for urban school districts. Future researchers may wish to conduct similar research studies across other school districts implementing the mClass: Reading 3D assessment to evaluate the consistency of findings. The qualitative portion of this study focused on the impact mClass: Reading 3D had on second-grade student reading achievement among the three selected schools. Future research is needed to determine the impact of mClass: Reading 3D on student reading achievement in other elementary grade levels.

Another recommendation for future research is the need to study schools that have implemented mClass: Reading 3D “with fidelity” to determine the true impact of mClass: Reading 3D. This research would need to explore all the components associated with the implementation process to include the following:

- the type of professional development utilized
- the use of literacy/reading coaches
- any additional resources utilized for the enhancement of mClass: Reading 3D
- the utilization of all mClass: Reading 3D program components
- the structure of the quality language arts schedule
- the credentials of teachers and administrators

**Summary**

In summary, this chapter described the qualitative and quantitative data used to guide this program evaluation to help answer the following research question:

*To what extent, if any, do teachers use student data to determine instructional practices that may impact student achievement?*

The need for this study has been attributed to the huge discrepancy that currently exists in students’ reading performance between K–2 and Grade 3. The statement of the problem
addresses a decline in reading proficiency among third-grade students (NCDPI, 2010b) which led to the adoption of the mClass: Reading 3D program. The mClass: Reading 3D assessment identifies the needs of struggling readers to improve reading achievement. The purpose of the study explored the extent to which the mClass: Reading 3D program impacts students’ reading achievement in second grade, the extent teachers use student data to drive instruction, and the extent professional development impacts students reading achievement. Based on the collected data, this study is significant in that conclusions and recommendations have been provided to improve the implementation of mClass: Reading 3D.

Overall, mClass: Reading 3D has had a positive impact the extent that teachers use student data to determine instructional practices that may impact student achievement. Eighty-four percent of teachers (37 out of 44) rate the effectiveness of mClass: Reading 3D as having a somewhat positive to positive impact on student reading achievement. According to collected data, the mClass: Reading 3D program is viewed favorably by teachers, principals, and transformational/instructional coaches. Classroom instruction has been positively impacted through better differentiation, rigorous instruction, and utilization of data to drive instruction. However, teachers are just beginning to “dig deep” into the data analysis process to inform instruction. Although teachers respond positively to the data, how to successfully manage and effectively utilize all components of the program continue to pose a challenge (see Appendix H). As K-3 teachers and principals in the district continue to collaborate and use the data to drive instruction, staff development should be ongoing to address fidelity issues and to allow educators to utilize the program components to their fullest potential to maximize student reading achievement.
As far as student achievement and test scores are concerned, this study revealed there was “no positive impact” on the number of students achieving reading proficiency after two years of implementation of mClass: Reading 3D in second grade during the 2012-2013 school year. The researcher attributed the lack of student growth to the fidelity issues associated with program implementation. Klein and Sorra (1996) echoed, “Implementation is the critical gateway between the decision to adopt the innovation and the routine use of the innovation within an organization” (p. 1,057). In order to yield expected results, implementers must ensure that the program has been implemented with fidelity.

Finally, results and recommendations from this study will be shared with the superintendent and his administrative cabinet in the selected school district to build on implementation of mClass: Reading 3D.

APPENDIX A: THE ACHIEVEMENT GAP IN NORTH CAROLINA

The Achievement Gap in North Carolina

Prepared by the Public Schools of North Carolina
North Carolina Department of Public Instruction
Dr. June St. Clair Atkinson, State Superintendent

The academic achievement gap between and among groups of students continues to be a persistent problem. Data documenting this problem typically highlight the scores by students tested in K-12 schools and the attending markers that accompany this problem. For example, students who score at proficiency levels and above on standardized tests typically populate general education and accelerated studies classes, while those students who score at the basic or below level of proficiency are often described as struggling students for whom instructional and learning interventions are provided.

Determining the causes for the achievement gap among students is not an easy or definitive task because many factors contribute to the achievement gap. However, socio-economic status and race are often associated with academic achievement as evidenced by the findings and conclusions of many research studies and anecdotal reports about different student populations. Many interventions and strategies have been used and continue to be used to decrease this persistent problem.

Several problems and concerns have impacted efforts to eliminate the achievement gap, however. For example, long-term fiscal crises on the global, national, state, and local levels contribute to an erosion of this country’s political and economic commitment to fully funding early childhood education. Paired with inadequate early childhood funding is the research data that questions the sustained long-term benefits of programs such as Head Start. Differences in educational philosophies of state and national legislators and other political leaders further diminish the benefits of early childhood education as a funding priority. Intervention strategies to close the achievement gap, therefore, are
subject to inconsistent and inadequate funding that does not provide a favorable educational environment in which students most in need of early childhood education can be taught before the achievement gap becomes a resistant reality.

In 2010, State Superintendent Atkinson established the Office of Early Learning to focus on the Pre-K to Grade 3 learning continuum and the alignment of standards, curriculum, instruction, and assessment across the early grades. This move was intended to leverage the extraordinary gains made by children served in the state’s pre-kindergarten program by strengthening the educational supports and structures for all children pre-kindergarten through third grade.

The long-term impact of state-funded pre-kindergarten was established in 2010 and reaffirmed in 2011 by two rigorous independent studies.

- In 2010, an evaluation by UNC-Chapel Hill found a significant impact of pre-kindergarten on student achievement at 3rd grade and a narrowing of the achievement gap.
  

- In 2011, Duke University found a significant impact of pre-kindergarten on student achievement at 3rd grade and reduction in special education placement.
  

In concert with these interventions and strategies, the North Carolina Department of Public Instruction is providing an annotated bibliography of some of the many documents—research and
otherwise—written about this academic issue. This bibliography is provided to users as an alphabetical listing of resources for quick referral as well as an annotated source with brief summaries for more selective study. Updates will be provided periodically. Our goal is to provide a substantive body of literature about the achievement gap to inform and to guide current and future efforts to eliminate it. We welcome your suggestions.

APPENDIX B: MCLASS: READING 3D ALIGNMENT WITH
K-3 COMMON CORE ELA STANDARDS

Program Alignment to K-12 Common Core Standards

On June 2, 2010 the National Governors Association Center for Best Practices (NGA Center) and the Council of Chief State School Officers (CCSSO) released the K-12 Common Core Standards.

The table that follows illustrates alignment of mCLASS®:Reading 3D™ components to the Common Core in English Language Arts standards for Grades K-5. Specifically, the alignment pertains to the following:

- Reading Standards for Literature K-5 (pages 1–6)
- Reading Standards for Informational Text K-5 (pages 6–10)
- Reading Standards: Foundational Skills (pages 11–14)

### Range and Level of Text Complexity

By the end of the year, read and comprehend informational texts, including history/social studies, science, and technical texts, at the high end of the grades 4-5 text complexity band independently and proficiently.
Dear Dr. Emanuel,

I am writing to request permission to conduct an evaluation on mClass: Reading 3D in the Public Schools of Robeson County. I am currently enrolled in the Doctoral Program of Educational Leadership at East Carolina University in Greenville, N.C. As I prepare for the study, I am interested in the teacher and administrator perceptions of the implementation and effectiveness of mClass: Reading 3D in the Public Schools of Robeson County.

What is the Purpose of this Study?

Through this study, the researcher intends to answer the following question:

1. To what extent do teachers use student data to determine instructional practices that may impact student achievement?

Procedures

If you agree for the Public Schools of Robeson County to participate in this study, I ask permission to do the following:

- Collect data, using a stratified random sampling on the teachers' and administrators' perspectives using interviews, document analysis, and a survey
- Video and tape record all interviews, with permission of participants at convenient times

Timeline

Interviews and surveys will be conducted in January 2015. The expected date for data analysis will be January 2015.
Benefits

The results of this study will provide a deeper understanding of teachers' and administrators' perceptions as it relates to the strengths and weaknesses of mClass: Reading 3D. In addition, the information provided from this study may be used to improve existing and future implementation and professional development of mClass: Reading 3D.

While it is not the intent of the investigator to ask intrusive questions, some participants may have a higher level of sensitivity to revealing information than anticipated. The majority of the information gathers is intended to give participants a high degree of control over the information chosen to share with the researcher. Participants will be informed that they may withdraw from the study at any time.

Compensation

No compensation will be provided to any participants.

Confidentiality

Documentation collected during this study will be kept private. Published reports will not include any information that will make it possible to identify a subject or school. Research records, videos, and audio recordings will only be available to the researchers of this study. These files will be kept in the researcher's home under lock and key. The data collected is only intended to be published in the researcher's doctoral dissertation for East Carolina University.

Voluntary Nature of the Study

Participation in this study is voluntary. The Public Schools of Robeson Count’s decision whether or not to participate will not affect current or future relations with the researchers of this study or East Carolina University. If you decide to participate, you have the option to withdraw from the study or refuse to answer any questions at any time.

Contacts and Questions

If you have any questions at any time, the researcher may be contacted using the information provided below:

Jill Hathaway: jill.hathaway@robeson.k12.nc.us 910-827-4442

Feel free to contact the dissertation chairperson, Dr. William Grobe.

Dr. William Grobe: GROBEW@ecu.edu or 252-328-6499

Consent to Participate

I have read and understand the above information. A copy of this form has been provided by the researcher. I agree to participate in this study with the understanding that I may choose not to participate or to stop participating at any time without penalty or loss of benefits to which I am otherwise entitled.
Dear Participant,

As a doctoral student at East Carolina University in the Educational Leadership Department, I am asking you to take part in my research study titled “mClass: Reading 3D—Utilization of Student Data to Determine Instructional Practice.”

The purpose of this research is to determine to what extent, if any, mClass: Reading 3D has had on reading achievement on second grade students, teacher professional development, and data used to drive instruction. By doing this research, I hope to answer the following questions:

1. To what extent, if any, do teachers use student data to determine instructional practices that may impact student achievement?

Your participation is completely voluntary.

You are being invited to take part in this research because you have a direct impact on the implementation of the mClass: Reading 3D assessment. The amount of time it will take you to complete this survey is approximately 15 minutes.

If you agree to take part in this survey, you will be asked questions that relate to the implementation of mClass: Reading 3D, professional development, and the use of student data to drive instruction.

This research is overseen by the ECU Institutional Review Board. Therefore some of the IRB members or the IRB staff may need to review my research data. However, the information you provide will not be linked to you. Therefore, your responses cannot be traced back to you by anyone, including me or the university.

If you have questions about your rights when taking part in this research, call the Office of Research Integrity & Compliance (ORIC) at phone number 252-744-2914 (days, 8:00 am-5:00 pm). If you would like to report a complaint or concern about this research study, call the Director of ORIC, at 252-744-1971.

You do not have to take part in this research, and you can stop at any time. If you decide you are willing to take part in this study, please check the box below and continue on with the following survey link.
Yes, I agree to participate in this survey questionnaire.

https://ecu.az1.qualtrics.com/SE/?SID=SV_6o3KaFvE3z0Cweh

Thank you for taking the time to participate in my research.

Sincerely,

Jill O. Hathaway
Principal Researcher
APPENDIX E: TEACHER SURVEY QUESTIONS

General Information

1. What is your current position at the school?
   • Kindergarten Teacher
   • 1st Grade Teacher
   • 2nd Grade Teacher
   • 3rd Grade Teacher

2. How many years have you taught in your current grade level?
   • 0-3 years
   • 4-6 years
   • 7-10 years
   • 11-20 years
   • 21+ years

3. How many years of experience do you have in education?
   • 0-3 years
   • 4-6 years
   • 7-10 years
   • 11-20 years
   • 21+ years

4. What is the highest degree you have obtained?
   • BA/BS Degree
   • Master’s Degree
   • Doctorate Degree

5. How long have you been implementing the mClass: Reading 3D assessment?
   • 1 year
   • 2 years
   • 3 years
   • 4+ years

Student Assessment

6. How would you rate the effectiveness of mClass: Reading 3D on student achievement?
   • Positive Impact
   • Somewhat Positive Impact
   • Somewhat Negative Impact
   • Negative Impact
7. How much time does it take to administer the mClass: Reading 3D benchmark assessment per student?
   • 1-15 minutes
   • 16-30 minutes
   • 31-45 minutes
   • 46-60 minutes

Data Driven Instruction

8. How often do you use mClass: Reading 3D data to modify student instruction?
   • Daily
   • Weekly
   • Monthly
   • Never

9. How do you use your data to drive instruction? (Check all that apply.)
   _____ Small Group Instruction
   _____ Early Intervention
   _____ Differentiating Instruction
   _____ PLCs
   _____ Grade Level Planning
   _____ Parent Conference
   _____ Purchase of classroom materials
   _____ All of the above
   _____ None of the above
   _____ Other (specify): _______________________

10. How frequently is progress monitoring data used for setting student goals?
    • Daily
    • Weekly
    • Monthly
    • Never

11. How would you rate the impact of assessment and data to guide instruction at your school?
    • Positive Impact
    • Somewhat Positive Impact
    • Somewhat Negative Impact
    • Negative Impact
Professional Development

12. How much staff development did you receive prior to the implementation of mClass: Reading 3D?
   • 1-4 hours
   • 5-9 hours
   • 10-14 hours
   • 15 + hours

13. How would you rate the Train the Trainer (TOT) model to fully prepare teachers to use the mClass: Reading 3D assessment in their classrooms?
   • Positive Impact
   • Somewhat Positive Impact
   • Somewhat Negative Impact
   • Negative Impact

14. Rate the staff development you received in the use of benchmark data.
   • Positive Impact
   • Somewhat Positive Impact
   • Somewhat Negative Impact
   • Negative Impact

15. Rate the staff development you received in the use of progress monitoring.
   • Positive Impact
   • Somewhat Positive Impact
   • Somewhat Negative Impact
   • Negative Impact

16. What is your overall satisfaction with the implementation of mClass: Reading 3D?
   Positive Impact, Somewhat Positive Impact, Somewhat Negative Impact, Negative Impact

   ___ Time for testing and administration activities
   ___ Using and interpreting the assessment results
   ___ Promptness in receiving assessment result
   ___ Clarity of the NC assessment administration schedule for benchmarking
   ___ Ease of assessment devices
   ___ Ease of syncing
   ___ Technical difficulties with mClass: Reading 3D
17. Which resources have you used for support with mClass: Reading 3D? (Check all that apply.)
   ____ Amplify Customer Care
   ____ Train the Trainer
   ____ District Coach
   ____ Department of Public Instruction Staff
   ____ TRC Video Tutorial on NC website
   ____ Online Training Module: DIBELS Next
   ____ mClass: Reading 3D Monthly Newsletter

18. Rate the impact of these mClass: Reading 3D resources.
   Positive Impact, Somewhat Positive Impact, Somewhat Negative Impact, Negative Impact
   ____ Amplify Customer Care
   ____ Train the Trainer
   ____ District Coach
   ____ Department of Public Instruction Staff
   ____ TRC Video Tutorial on NC website
   ____ Online Training Module: DIBELS Next
   ____ mClass: Reading 3D Monthly Newsletter

Other Questions:

1. What suggestions would you offer to improve mClass: Reading 3D to ensure continued success?

2. What additional support do you need for the mClass: Reading 3D program?

3. Please share additional comments regarding positive aspects of mClass: Reading 3D.

4. Please share additional comments regarding constructive feedback for mClass: Reading 3D improvement.

5. Select your preference for the type of additional training and/or support you feel would be beneficial in the future. (Choose a maximum of 3, and rank in order of preference 1=highest).
   ____ Benchmark and/or progress monitoring administration
   ____ Benchmark and/or progress monitoring data to inform instruction
   ____ Now What? Tools (i.e. Home Connect, Item Level Advisor and/or Small Group Advisor
   ____ Reporting and Analysis Suite (for school & district admin’s only)
   ____ Technology (PDAs, netbook, etc.)
6. How have you used the HomeConnect Parent Letters (found within Now What? Tools) this school year? (Check all that apply.)
   ____Sent home to parents as individual report
   ____Shared at Parent/Teacher Conference
   ____Used in conjunction with student report card
   ____Used in conjunction with student progress report
   ____Did not use
   ____Other: ____________________________
   ____________________________
   ____________________________
APPENDIX F: PRINCIPAL AND TRANSFORMATIONAL/INSTRUCTIONAL COACH INTERVIEW QUESTIONS

Principal and Transformational/Instructional Coach Interview Questions

1. How do you use the reports found on the Reporting and Analysis Suite to answer the following questions:

   Which classrooms need additional instructional support?
   Which categories of student academic difficulty did you find significant?
   Which data/strategies do you use to show student achievement?

2. Which specific features do you like most about mClass: Reading 3D and why?
   • Staff is able to rapidly screen and progress monitor students
   • Web analysis and reporting for coaches and administrators
   • Tracking student progress from year to year and class to class
   • Correlations to a wide range of instructional materials available in many K-3 classrooms and reading programs
   • Ease of using data to communicate goals and expectations to stakeholders such as parents, vertical planning teams, etc.
   • Use of data to determine where professional development and resources are needed
   • Other?

3. Have instructional practices changed in grades K-3 since the implementation of mClass: Reading 3D? If so, how?

4. Describe the impact of mClass: Reading 3D on student achievement?

5. Are there strengths to the mClass: Reading 3D program? If so, what are they?

6. Are there challenges to the implementation of the mClass: Reading 3D program? If so, what are they?

7. What recommendations do you have for improvements of mClass: Reading 3D?

8. Are there issues with staff development for the implementation of mClass: Reading 3D? If so, what are they?
9. Which resources have you used for support with mClass: Reading 3D?
   ___ Amplify Customer Care
   ___ Train the Trainer
   ___ District Coach
   ___ Department of Public Instruction Staff
   ___ TRC Video Tutorial on NC website
   ___ Online Training Module: DIBELS Next
   ___ mClass: Reading 3D Monthly Newsletter

10. What suggestions would you offer to improve mClass: Reading 3D to ensure continued success?

11. Select your preference for the type of additional training and/or support you feel would be beneficial in the future. (Choose a maximum of 3, and rank in order of preference 1=highest).
   ___ Benchmark and/or progress monitoring administration
   ___ Benchmark and/or progress monitoring data to inform instruction
   ___ Now What? Tools (i.e. Home Connect, Item Level Advisor and/or Small Group Advisor
   ___ Reporting and Analysis Suite (for school & district admins only)
   ___ Technology (PDA’s, netbook, etc.)
Dear Participant,

As a doctoral student at East Carolina University in the Educational Leadership Department, I am asking you to take part in my research study entitled, “mClass Reading 3D—An Assessment of the Impact of Continuous and Ongoing Professional Staff Development.”

The purpose of this research is to determine to what extent, if any, mClass: Reading 3D has had on reading achievement on second grade students, teacher professional development, and data used to drive instruction. By doing this research, I hope to answer the following questions:

1. To what extent, if any, did continuous and ongoing professional development associated with mClass: Reading 3D provide teachers with the necessary skills to impact students’ reading achievement?

Your participation is completely voluntary.

You are being invited to take part in this research because you have a direct impact on the implementation of the mClass: Reading 3D assessment. The amount of time it will take you to complete this interview is approximately 30 minutes.

If you agree to take part in this interview questionnaire, you will be asked questions that relate to the implementation of mClass: Reading 3D, professional development, and the use of student data to drive instruction. The interview process will be audio recorded to ensure proficiency of data collection.

This research is overseen by the ECU Institutional Review Board. Therefore some of the IRB members or the IRB staff may need to review my research data. However, the information you provide will not be linked to you. Therefore, your responses cannot be traced back to you by anyone, including me or the university. If you consent to participate in the interview questionnaire, please check the box below and sign.

☐ Yes, I agree to participate in this interview questionnaire.

☐ Yes, I agree to be audio recorded.
If you have questions about your rights when taking part in this research, call the Office of Research Integrity & Compliance (ORIC) at phone number 252-744-2914 (days, 8:00 am-5:00 pm). If you would like to report a complaint or concern about this research study, call the Director of ORIC, at 252-744-1971.

Thank you for taking the time to participate in my research.

Sincerely,

Jill Hathaway
Principal Researcher
APPENDIX H: TEACHER SURVEY RESPONSE RESULTS

Q1: A total of 44 teachers responded to the teacher survey question regarding the current teaching position. Responses indicated that more first-grade teachers responded to the question. The lowest response was from second grade teachers.

Q2: The majority of responding teachers for this teacher survey question have taught in their current grade level for 0-3 years. Only 3 responders have taught in their current grade level 21+ years.
Q3: The majority of responding teachers for this teacher survey question have 11-20 years of experience. The smallest percentage of responders have 4-10 years teaching experience.

Q4: Thirty-two teachers have a BA/BS Degree, while 12 teachers have obtained a Master’s Degree. Currently, no responders have a Doctorate Degree.
Q5: Thirty-two responders have implemented the mClass: Reading 3D assessment for 3 or more years. Eleven responders have implemented the assessment 2 or less years.

Q6: Eighty-four percent of the responders indicate mClass: Reading 3D has had a somewhat positive to positive impact on student achievement. Sixteen percent of the responders indicate mClass: Reading 3D has had a somewhat negative to negative impact on student achievement.
Q7: Survey results indicate 48% of the responders spend 31-45 minutes per student administering the mClass: Reading 3D benchmark assessment. Seven percent of the responders spend 45-60 minutes per student administering the mClass: Reading 3D benchmark assessment, while the remaining responders spend less than 31 minutes per child.

Q8: Twenty responders use mClass: Reading 3D data to modify student instruction on a weekly basis, while 13 responders use the data on a monthly basis. Eight responders use the data daily, and one responder never uses the data to modify student instruction.
**Q9:** The most popular responses to the teacher survey question include small group instruction, differentiated instruction, and parent conference. The least chosen responses to drive instruction are the purchase of classroom materials and none of the above.

**Q10:** Nineteen responders use mClass: Reading 3D progress monitoring data to set student goals on a weekly basis, tying with the same number of responders who use the data on a monthly basis to set student goals. A small percentage of responders use the data on a “daily” basis or “never” use the data to set student goals.
Q11: Eighty-three percent of the responders rate the impact of assessment and data to drive instruction on a somewhat positive to positive scale. Seventeen percent of the responders rate the impact of assessment and data to drive instruction on a somewhat negative to negative scale.

Q12: The vast majority of responders, 81%, have had 1-4 hours of staff development prior to the implementation of mClass: Reading 3D. Five percent of the responders have had 10 or more hours of training on mClass: Reading 3D prior to implementation.
Q13: Seventy-three percent of the responders rate the Train-the-Trainer (TOT) model to fully prepare teachers to use the mClass: Reading 3D assessment on a somewhat positive to positive scale. Twenty seven percent of the responders rate the Train-the-Trainer (TOT) model to fully prepare teachers to use the mClass: Reading 3D assessment on a somewhat negative to negative scale.

Q14: Ninety percent of the responders rate the staff development they received in the use of benchmark data on a somewhat positive to positive scale. Ten percent of the responders rate the staff development they received in the use of benchmark data on a somewhat negative to negative scale.
Q15: Eighty five percent of the responders favorably rate the staff development they received in the use of progress monitoring. Fifteen percent of the responders rate the staff development they received in the use progress monitoring on a somewhat negative to negative scale.

Q16: Eighty-four percent of the responders rate the overall satisfaction with the clarity of the NC schedule for benchmarking on a somewhat positive to positive scale. Ninety-five percent positively rate the promptness in receiving assessment results. Ninety-three percent rate using and interpreting the assessment results on a somewhat positive to positive scale. Sixty four percent are positively satisfied with the time for testing and administration activities.
Q16 (cont.): Teacher survey responders rate their overall satisfaction as a favorable experience with technology.

Q17: The Train-the-Trainer model is the most utilized resource used to support mClass: Reading 3D, while the mClass: Reading 3D monthly newsletter is the least utilized resource. Other resources specified include on-site training and observing other teachers.
Q18: The majority of responders rate the impact of the listed mClass: Reading 3D resources as having a somewhat positive to positive impact.
APPENDIX I: PRINCIPAL AND TRANSFORMATIONAL/INSTRUCTIONAL COACH INTERVIEW QUESTION RESULTS

Q1: How do you use the reports found on the Reporting and Analysis Suite to answer the following questions:

- Which classrooms need additional instructional support?
- Which categories of student academic difficulty did you find significant?
- Which data/strategies do you use to show student achievement?

</tr>
</tbody>
</table>

*Red highlights difference in responses.*
Q6. Are there challenges to the implementation of the mClass: Reading 3D program? If so, what are they?

| **Principals** | • Transition of teachers  
| | • Lack of on-going and effective training  
| | • Lack of instructional coaches  
| | • Train the Trainer model not effective at every school  
| | • Technology issues with syncing, slow systems, and late emails about problems*  |
| **Transformational/ Instructional Coaches** | • Transition of teachers  
| | • Lack of on-going and effective training  
| | • Lack of instructional coaches  
| | • Train the Trainer model not effective at every school  
| | • Time management*  
| | • Progress monitoring at rate in low performing school (not enough time)*  |
| **Common Themes** | • Transition of teachers  
| | • Lack of on-going and effective training  
| | • Lack of instructional coaches  
| | • Train the Trainer model not effective at every school  |

*Red highlights difference in responses.*
Q7. What recommendations do you have for improvements to mClass: Reading 3D?

**Principals**
- Elimination of mClass: Reading 3D in 3rd grade*
- Instructional coach in every school to facilitate the learning process and provide support for teachers
- Provide on-going training to principals and teachers
- Provide district-wide training to new teachers*
- Eliminate Train the Trainer Model as the primary facilitator (not a classroom teacher)
- Provide Reading Foundations training to every K-3 teacher to obtain background knowledge for teaching phonics

**Transformational/Instructional Coaches**
- Provide on-going training to principals and teachers
- Re-examine benchmark window at beginning of the year*
- Better preparation for new teachers at the university level*
- Improve Now What? Tools to show scope and sequence of instruction*
- Re-examine the wide growth in grade levels (gaps in assessment)*
- Instructional coach in every school to facilitate the learning process and provide support for teachers
- Eliminate Train the Trainer Model as the primary facilitator (not a classroom teacher)
- Provide Reading Foundations training to every K-3 teacher to obtain background knowledge for teaching phonics

**Common Themes**
- Provide on-going training to principals and teachers
- Instructional coach in every school to facilitate the learning process and provide support for teachers
- Eliminate Train the Trainer Model as the primary facilitator (not a classroom teacher)
- Provide Reading Foundations training to every K-3 teacher to obtain background knowledge for teaching phonics

*Red highlights difference in responses.*
Q8. Are there issues with staff development for the implementation of mClass: Reading 3D? If so, what are they?

<table>
<thead>

APPENDIX J: IRB APPROVAL LETTER

Notification of Initial Approval: Expedited

From: Social/Behavioral IRB
To: Jill Hathaway
CC: Bill Grobe
Date: 1/21/2015
Re: UMCIRB 14-001881 mClass: Reading 3D - Utilization of Student Data to Determine Instructional Practices

I am pleased to inform you that your Expedited Application was approved. Approval of the study and any consent form(s) is for the period of 1/21/2015 to 1/20/2016. The research study is eligible for review under expedited category #6, 7. The Chairperson (or designee) deemed this study no more than minimal risk.

Changes to this approved research may not be initiated without UMCIRB review except when necessary to eliminate an apparent immediate hazard to the participant. All unanticipated problems involving risks to participants and others must be promptly reported to the UMCIRB. The investigator must submit a continuing review/closure application to the UMCIRB prior to the date of study expiration. The Investigator must adhere to all reporting requirements for this study.

Approved consent documents with the IRB approval date stamped on the document should be used to consent participants (consent documents with the IRB approval date stamp are found under the Documents tab in the study workspace).

The approval includes the following items:
