Abstract: Methods and surgical devices are described that can endoscopically manipulate a length of a suture. A forceps instrument is endoscopically introduced into the body. The forceps instrument includes opposing grasping members having respective pairs of spaced-apart prongs that extend away from the respective grasping members. Each pair of prongs defines an opening therebetween. A length of suture is grasped using the forceps instrument such that the suture is captured by the pairs of prongs and a portion of the suture extends across the openings defined by the pairs of prongs. The portion of the suture that extends across the openings is grasped with another surgical instrument.

1 Special categories of cited documents
   "A" document defining the general state of the art which is not considered to be of particular relevance
   "E" earlier application or patent but published on or after the international filing date
   "L" document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)
   "O" document referring to an oral disclosure, use, exhibition or other means
   "P" document published prior to the international filing date but later than the priority date claimed
   "T" later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention
   "X" document of particular relevance, the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone
   "Y" document of particular relevance, the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art
   "K" document member of the same patent family
