

INDUSTRY OF DEATH: THE EFFECTS OF INDUSTRIALIZATION ON NORTH CAROLINA HEADSTONES

By

Simon Goldstone

April, 2016

Director of Thesis: Charles R. Ewen, PhD

Major Department: Anthropology

In the late 19th and early 20th centuries, a shift from marble headstones to granite has been observed across the United States and in parts of Canada, as well. The goal of this study is to determine when this shift in headstone material occurred in North Carolina, and what factors contributed to this transition. Another objective is to determine how this shift impacted the expression of cultural meaning in North Carolina cemeteries. By examining how the shift from marble to granite caused changes to headstone morphology and style, this project will show how memorialization of individuals is influenced by headstone manufacturing processes. Ultimately, this study illustrates the effects of industrialization on the North Carolina cultural landscape as manifested in the state's cemeteries by analyzing the means of production and the expression of identity.

ACKNOWLEDGMENTS

There are numerous people I would like to thank for their assistance with my thesis. Firstly, I would like to thank Dr. Charles R. Ewen for his patience and guidance. He gave me the opportunity and the confidence to pursue my own research interests, and was supportive throughout the entire thesis process. Whenever I needed advice or suggestions, his door was always open, and for that I am indebted to him.

I would also like to thank Dr. Laura Mazow and Dr. Megan Perry for serving as members on my committee. Their support and guidance through the writing process of my thesis has been invaluable. In particular, I would like to thank Dr. Mazow and her students for helping me with my data collection. Without them, my thesis would not have been possible.

Additionally, I would like to thank Dr. Wade Dudley for being an outside reader of my thesis. His guidance during the background research phase of my thesis, and his enthusiasm for my topic (whether feigned or genuine) helped me stay motivated and focused.

I also need to thank the members of my cohort. The friendships that we have made have helped keep me sane, and I am so grateful for the support that they have offered me during times of stress and aggravation.

Introduction

The study of cemeteries has figured prominently in historical archaeology, because they are sites where the identity and social memory of a community are materially manifest. Numerous studies in the past have shown how ideology and culture change are reflected in shifting trends in headstone iconography (e.g., Dethlefsen and Deetz 1966; Deetz 1977; Dethlefsen 1981; Nutty 1984; Gradwohl 1993; Ludwig 1966; Giroux 2009;). For example, Dethlefsen and Deetz (1966) demonstrated that changes in headstone iconography reflected changes in shared beliefs and values at a regional scale. But is iconography the only headstone attribute that can serve as an indicator of such changes?

More recent studies have examined how cultural expression within cemeteries is subject to the material factors of headstone manufacture (e.g., Bauer et al. 2002; Mallios & Caterino 2007; Mallios & Caterino 2011; Brennan 2011; Reynolds 2012; Reiffenstein and Selig 2013). The materials and manufacturing techniques of headstone production can influence how cultural meaning manifests within cemeteries. Such processes include improvements in quarrying and stonecutting technology, as well as long-distance expansion of headstone markets.

In American cemeteries, the influence of manufacturing processes is best exemplified by a gradual shift in headstone material from marble to granite between the late 19th and early 20th centuries. The cause of this shift is directly related to industrialization and innovative technologies, such as the pneumatic hammer. The purpose of this project is to establish the chronology when this shift in headstone material occurred in North Carolina using quantitative analysis of headstone manufacture dates. In addition to the shift from marble to granite, are other aspects of headstone morphology affected by these alternative manufacturing processes? By

answering these questions, I will shed light on the effects of industrialization in North Carolina cemeteries, and demonstrate the relationship between headstone production and the memorialization of identity in North Carolina cemeteries.

This project is important because it seeks to examine the link between a society's means of production (i.e., the technology, tools, and raw materials utilized in the process of production) and the expression of cultural meaning and ideology within that society's material culture. As will be discussed, the development of the granite industry was dependent on technological improvements in stonecutting and an expansion of available markets through the construction of new railroad systems. In North Carolina, based on work in other areas of the United States, I expect that granite headstones began to outnumber marble headstones during the 1920s or 1930s. As grave markers in North Carolina shifted from marble monuments to granite, it is expected that the style and form of headstones changed in relation to the new methods of headstone production and material.

Background History

Before examining the headstone patterns of North Carolina, it is important to understand why the transition from marble to granite markers ever occurred. Because granite is a harder substance than marble, it was more difficult to work with prior to the advent of power tools. In addition, access to granite was geographically limited prior to the expansion of railway systems capable of transporting the material to various regions. In particular, the South experienced this transition in headstone materials much later than the North, due to delayed industrialization in the region. While granite reserves occur naturally in North Carolina, these sources historically have not been used for the purposes of monuments. An examination of the documentary record will demonstrate the factors that led to granite's replacement of marble as the predominant headstone material in North Carolina, as well as the effects of industrialization on the cemetery landscape of North Carolina.

In early 19th century North Carolina, marble was one of the preferred headstone materials, although other local sources of stone, such as slate and soapstone, were commonly used, as well (Little 1998:77-78). Granite was also available, but it was utilized as bases for headstones, rather than being worked into headstones themselves. This is because granite is an incredibly hard igneous rock, and stonecutters of this period lacked the tools and skills to carve, polish, and inscribe this material (Little 1998:78). The Mohs scale of mineral hardness ranks the scratch resistance of various minerals on a scale of 1 to 10, where 1 is the softest and 10 is the hardest. On this scale, marble has a hardness value between 3 and 4, while granite has a hardness value between 6 and 8 (Trinkley 2013:21). Soapstone, which occurs in small deposits throughout the Piedmont (Little 1998:77), ranks on this scale as a 1, while slate, also found in the Piedmont

(Little 1998:78), ranks from 3 to 4. The variation in hardness is dependent on the quality of the stone, which is itself a determining factor in the selection of stones used for monuments.

Obviously, soapstone, slate, and marble, are much softer materials than granite, making them easier substances to sculpt and carve, leading to their value as source materials for headstones in the early 1800's. While the hand tools used in the 19th century were suitable for carving and engraving into these relatively soft stones, they were not effective for granite carving.

Unlike soapstone and slate, however, marble does not occur naturally in North Carolina. Therefore, marble that was being used for monuments and buildings within the state were being imported from other regions of the country. In the late 1700s, marble was imported into North Carolina from Pennsylvania and Vermont. After the turn of the century, marble was coming into the state from numerous sources, including Tennessee, Georgia, Maryland, Kentucky, and New York. Prior to the construction of an expansive railway network, transporting marble into the state was quite difficult and costly. Each region within the state acquired marble from varying methods of transportation. North Carolina's Coastal Plain was receiving marble from New England, the mid-Atlantic, and Charleston largely from sailing vessels. Overland and river transportation were utilized to transport marble to the Piedmont region, with the northern portion receiving the stone from the Northeast, while the southern half acquired its share mainly from South Carolina. Because marble was not easily accessible, it was an expensive commodity that was initially only affordable by the upper class (Little 1998:180-181).

Why, then, was marble so desirable during this time period when there were other mineral resources of similar hardness that were more readily available within the state? Slate, for

example, is found in abundance in the Carolina Slate Belt, which stretches from South Carolina to Virginia along the eastern Piedmont (Little 1998:78).

Marble's value over other stones during this period derives from its geological qualities. Because slate has a high sedimentary content, it is prone to flaking, making it less suitable for headstone carving (Little 1998:78). Marble, on the other hand, was desirable because of its ease of sculpting and its relative resistance to shattering.

Cultural trends were another factor that made marble highly sought after. The Greek Revival movement of the 19th century swept across North America, and influenced American culture ranging from politics to architecture. The classical civilization's traditional usage of marble sparked a trend of buildings and monuments being constructed from the stone during this movement (Bauer et al. 2002:92-93).

In the early 1800s, marble stonecutters in North Carolina were mostly artisans and craftsmen of European training. They immigrated to the United States to find work and practice their craft. They enjoyed higher status than their American counterparts as a result of their European training. Stonecutters followed the apprenticeship model, a system that had developed in Europe. Master craftsmen, generally located in large urban centers, established standards that spread across the nation through their apprentices. They also published patternbooks containing detailed designs of engravings and styles, which were disseminated nationwide. Marble stonecutters were able to broaden their markets nationally through newspaper advertisements in the 1800s. Demand was high enough that these artisans were capable of practicing their craft full-time. It was even common for marble cutters to sign their work. Usually, these specialists would set up in areas near railways where they could easily ship their products to clients (Little 1998:179).

The monuments created by marble cutters in the early 19th century had a tendency to be intricately worked and decoratively detailed. The geological properties of marble allowed craftsmen to demonstrate the skill they possessed in creating beautiful sculptures. The elegance of marble headstones brought status and beauty to the graves that they marked. However, the marble tombstone industry would undergo dramatic changes midway through the 1800s.

North Carolina's construction of railroads in the mid-19th century was a significant catalyst for these changes in the marble industry, as well as for broader economic changes to the state as a whole. Two of the earliest railroads in the state, the Raleigh & Gaston and the Wilmington & Weldon, were chartered in 1830 by the North Carolina legislature. The Wilmington & Weldon became connected to markets in the North in the 1850s, and construction of new lines running south further extended Wilmington's markets (Link 2009:141-142).

The most important railroad constructed in this era was the North Carolina Railroad (NCRR), chartered in 1849 and completed in 1856. The line ran from Goldsboro to Charlotte, extending over 223 miles across the state. The NCRR drastically reduced travel time and costs for both passengers and goods. Overall, the 1850s was a key period due to the growth of railroads in North Carolina, with the total length of train tracks rising from 283 miles to an astounding 922 miles (Link 2009:142-143).

The rise of the railway system brought an influx of marble and skilled craftsmen into North Carolina. Because of transportation along railroads, the cost of shipping marble was reduced by half (Little 1998:219). Local marble yards began popping up around the state, located along the new railroad lines. These enabled clients to buy marble headstones directly and locally, and these products were no longer only affordable by the wealthy. The middle class now had greater access to marble tombstones because of the material's reduced cost (Little 1998:180).

A significant contributor to the change of North Carolina's cemetery landscape was the Civil War. Over 40,000 North Carolinians lost their lives in the war (Link 2009:217). According to Little, most families in North Carolina had not purchased gravestones during the Civil War, and "the new marble yards prospered by supplying fashionable monuments to those North Carolinians who had buried many family members during the tragic years of the Civil War and Reconstruction and had cash to purchase suitable memorials for these loved ones" (1998:219-220).

As the 19th century entered its latter stages, the marble headstone industry began to change again. While railroads had initially brought prosperity to the small, local marble yards, it would eventually bring about their end. Larger companies began to absorb the smaller marble yards and consolidate them under one business. The rise of these commercial yards caused local artisans to vanish, and headstones started to become mass-produced. Mail-order monuments became the norm (Little 1998:230).

The nail in the coffin for the marble industry was the advent of new stonecutting technology, such as pneumatic hammers and drills, sandblasting, and carborundum as an abrasive. These tools allowed a new material to enter the market: granite.

As previously mentioned, granite ranks much higher on the Mohs Scale of Mineral Hardness than marble. Just as marble's geological properties made it more desirable than local stones for grave markers, granite's properties made it more desirable than marble. Because marble was a much softer material than granite, it was far more susceptible to deterioration through a variety of mechanisms. One such catalyst for deterioration is the presence of atmospheric pollutants. Marble monuments commonly develop a gypsum crust when water containing carbon dioxide evaporates from its pores, leaving behind trace amounts of

bicarbonate on the surface. Soot and sulfur dioxide from air pollution causes an oxidizing effect, turning the carbonate into gypsum. The soot and other pollutants leave the crust black or gray colored. Marble monuments with protruding parts (e.g., sculptures with fingers, noses, or flowers) are at increased risk of this deterioration because they have an greater surface to volume ratio that allows for larger transfers of carbonate to the surface of the marble. This process of gypsum crust development creates cavities within the monument (Meierding 1993:578-580; Trinkley 2013:21-22).

Other mechanisms include “sugaring,” weathering, erosion, and cracking. “Sugaring” is caused by intrusion of acidic water, and results in the surface of the stone crumbling into loose granules. Weathering is caused by the natural effects of wind, rain, and temperature changes, and results in a loss of polish to the monument surface, and can also reduce the crispness of details. Erosion is similar to sugaring, and can result in the deterioration of the surface, edges, and corners of the marker. Cracking refers to the development of fissures due to veins within the marble that are formed by impurities (Meierding 1993:573-577; Trinkley 2013:22-23). The problems associated with marble headstones are many, and their poor preservation was a key factor leading to the transition to granite headstones.

Before granite could be used as a viable headstone material, stonecutting technology needed to be improved so that it could be effectively quarried, carved, polished, and engraved. Originally, the American granite industry first developed along the coast of New England in the early 1800s. Low-cost transportation was necessary for the granite trade, as granite is heavy and has a low price per pound. The sailing vessels of New England provided the cheap transportation that was needed (Wood 2006:39).

One of the pioneers of the granite industry, Solomon Willard, developed important quarrying machinery in the 1820s. He was appointed the superintendent and architect for the Bunker Hill Monument, which he constructed from granite. He purchased a quarry in Quincy, Massachusetts, and to facilitate the extraction of granite, he “invented a boom derrick, lifting jack, pulling jack, and hoisting jack” (Wood 2006:39). Willard’s contributions helped to make quarrying commercially viable. New England quarry owners began to follow Willard’s lead and started developing new ways to quarry, handle, and transport granite (Wood 2006:40).

The first steam-powered rock drill was created by Joseph Couch of Massachusetts in 1849. His design was “the first drilling mechanism that did not depend solely on gravity for the drilling stroke” (Wood 2006:46), which allowed it to be used for drilling at various angles other than vertically. This design was improved upon numerous times over the following decades, including in 1852 by Joseph Fowle in Boston; in 1866 by Charles Burleigh in Fitchburg, Massachusetts; in 1871 by Simon Ingersoll in Brooklyn; and in 1873 by Henry Sergeant of New York City (Wood 2006:46).

Steam quarry drills became widespread in the 1870s, and truly changed the operation of quarries. These machines were in use until the 1920s, but their replacement by pneumatic drills began in the early 1900s. These drills, which were also developed in the Northeast, utilized compressed air to drive a piston, and could achieve six hundred blows per minute in early models (Wood 2006:46-47). Obviously, the Northeast was central to the development of the granite industry, as well as the introduction of the necessary stonecutting technology.

Pneumatic drills were useful for both quarrying, and carving monuments. In his *Monument Dealer’s Manual*, Omar H. Sample describes the delicate nature of these tools and how to properly care for them. “In a new tool, when properly fitted, the piston is not more than

one-quarter thousandth of an inch smaller than the barrel in which it works...” (Sample 1910:110). Because these tools are so precisely constructed, the smallest amount of dirt or grit can render them useless. To avoid such a situation from arising, Sample offers an interesting solution: “...have a tank large enough to hold all the tools in use filled with kerosene and gasoline, and when the tools are not in service, keep them immersed in the oil” (1910:109). This technique served to keep tools from rusting, and the gasoline would soften any dirt deposits that may have built up during use. Clearly, these new stonecutting tools brought with them new considerations for stonecutters, who had previously relied on little more than hammers and chisels for carving headstones from marble.

Naturally, granite headstones first began to appear in the Northeast, where the mineral was first being quarried. Numerous archaeological and historical studies have observed this transition from marble to granite occurring across North America. One of the earliest loci of transition is New Jersey, where Richard F. Veit and Mark Nonestied note that granite headstones became popular during the 1870s (2008:165). Monument dealers in the state began ordering “stock finished markers,” mass-produced slabs that simply required dealers to inscribe the stones with the desired engravings. This trend would soon become a hallmark of the granite headstone industry.

In northeastern Ohio, Andrew Bauer (2002:87,94) also notes that granite began replacing marble gravestones in the region during the 1870s, and that granite became the predominant headstone material between 1880 and 1890. In this study, the researchers also attribute this shift to the advancement in transportation networks within the state, as well as the advent of pneumatic drills, sandblasting, and carborundum as an abrasive (Bauer et al. 2002:93-94).

In San Diego, Mallios and Caterino (2011:445) observe that granite became the primary headstone material between 1880 and 1890, as well. Again, the transition to granite markers is attributed to advances in stonecutting technology, and marble's poor preservation (Mallios and Caterino 2011:446). This study was significant because it also reported trends in headstone form over time. The data shows a clear correlation between an increase in granite headstones and an increase in flat markers devoid of decorative elements (Mallios and Caterino 2011: 442). This is reflective of the headstone industry transitioning to mass production and standardization of shape and size.

Jerry Moore and his colleagues (1991) noticed the transition occurring in a Kansas Cemetery later than the Northeast and California. The data in this study clearly shows that in the 1910s, half of the headstones erected were marble, while the other half were made of granite. In the 1920s, granite made up 87% of the headstones placed during that decade, and continued to be the dominant headstone material in every decade afterwards (Moore et al. 1991:69). Interestingly, this study also examined the change in headstone height over time. A significant decrease in average headstone height occurred in the 1920s, corresponding with granite's role as the predominant headstone material within the cemetery (Moore et al. 1991:70). The data regarding trends in headstone form over time also show a strong correlation between an increase in granite markers and an increase in flat block markers (Moore et al. 1991:72), further demonstrating standardization of headstone form and size.

On Prince Edward Island, located off the coast of New Brunswick, Canada, Tim Reiffenstein and Nigel Selig (2013:173) observed the replacement of marble headstones by those of granite occurring in the 1920s. Similarly to the studies in Sand Diego and Kansas, these

researchers noted an increase in block markers corresponding to the shift to granite monuments (Reiffenstein and Selig 2013:168).

Numerous studies in Florida have identified granite as replacing marble as the primary headstone material in the early 20th century (Dethlefsen 1981; Giroux 2009; Reynolds 2012). Edwin S. Dethlefsen (1981:148), in a survey of four Alachua County cemeteries, notes that granite headstones begin to outnumber those of marble in the 1920s. In the same study, he shows that there is an increase in block headstones occurring concurrently to the introduction and growing popularity of granite headstones (Dethlefsen 1981:150).

Amy Larner Giroux (2009:79), in a study of St. Michael's Cemetery in Pensacola, Florida, notes that by 1930 granite is the predominant material being used within this graveyard. She also notes that there is a corresponding decrease in headstone size (Giroux 2009:76).

In a study of ten cemeteries across the state of Florida, Patrisha Reynolds (2012:80) demonstrates that granite markers began to outnumber marble ones between 1920-1939. Unlike the other studies previously mentioned, Reynolds reports her data in twenty-year periods, rather than by decade. She also notes that, instead of an increase in block markers, a significant increase in upright tablet markers occurs corresponding to the shift to granite (Reynolds 2012:77). This data may be skewed, however, with 704 of the total 1267 grave markers in her sample (i.e., 55.6% of the sample) coming from a single cemetery in Central Florida (Reynolds 2012:31). Therefore, it is possible that regional variation may be responsible for these results.

In North Carolina, few headstone studies have been performed, and they have focused mainly on ethnicity. For example, one early study examined the German pierced soapstone monuments found in Davidson County (Rauschenberg 1977). Another discusses the emerging

sense of American identity among Scots-Irish stonecutters in the Carolina Piedmont (Clark 1989).

Only one study, performed by M. Ruth Little (1998), has endeavored to systematically assess the headstones of North Carolina. While this work is primarily a study of architectural history that focuses on differences in design elements between the headstones of various ethnic and religious groups across North Carolina, the author does touch briefly upon the transition from marble to granite headstones within the state. Again, this shift is attributed to the introduction of improved stonecutting technology (Little 1998:231). While Little posits that granite monuments began to replace marble monuments by the 1930s (1998:231), she does not provide any quantitative data to support her assertion, nor does she include any discussion about how this conclusion was reached. An absence of citations only increases the uncertainty of this claim. It should be noted, however, that this subject was not the primary focus of Little's research, and it would be unfair to discount the value of her study based on this singular point of criticism.

While Little's claim remains to be tested archaeologically, it has some interesting implications. If her assertion is correct, then the transition from marble to granite headstones occurred later in North Carolina (i.e., 1930s) than in other parts of the country (i.e., 1870s-1920s). If this is the case, what factors could have contributed to this delayed transition in North Carolina compared to other regions?

It has been well established in the academic literature that industrialization of the South lagged behind that of its northern counterparts (e.g., Carlton 1990; Cobb 1984; Link 2009). This was due in part to the South's deeply rooted plantation economy, a largely rural population, and a lack of potential markets for manufactured goods. These factors contributed to uneven

industrial development between the North and South (Carlton 1990:448-449). This is especially true for the country's granite industry, which, as already mentioned, first developed on the New England coast in the early 1800s (Wood 2006:59). It was not until the end of the 19th century that the granite industry started developing in the South, with North Carolina and Georgia as the leading producers of granite in the region (Bowles 1930:3). The formation of these Southern granite industries was slow due to a lack of skilled laborers trained to use stonecutting tools, and limited available markets due to inadequate access to railroads for transportation of granite products (Ouzts 2002:589).

Another factor that contributed to the delayed predominance of granite headstones in North Carolina may be that the state's own granite deposits were not being used for monuments. The *Minerals Yearbook* is a yearly report published by the Department of the Interior and the United States Geological Survey (USGS). These reports document the use and flow of minerals and other geological resources throughout the United States. In the report from 1883, which at the time was called *Mineral Resources of the United States*, Albert Williams, Jr., provides an analysis of how the United States building stone resources were utilized in the census year 1880. He divides building stone into four categories: marble and limestone; sandstone; crystalline siliceous rocks (granites are included within this category); and slate. It is important to note that granite does not make up its own category at this time. According to the report, there were 616 marble and limestone quarries in operation in 1880, compared to 313 quarries of crystalline siliceous rock. The report also states that over 65 million cubic feet of marble and limestone were produced in 1880, while only 20 million cubic feet of crystalline siliceous rock were produced (Williams 1883:450). It is evident that at this time, marble was still the main mineral resource being produced in the nation.

Williams (1883:451) also includes statistics about the stone production of individual states. Among the states listed as producers of crystalline siliceous rocks, North Carolina is nowhere to be found. In fact, North Carolina is not listed as a producer of any of the four types of stones discussed in this section.

The 1905 report on the stone industry, prepared by A.T. Coons, includes a breakdown of how the values of different kinds of stone produced in the United States changed between 1895 and 1905. The various stone industries discussed include: granite, trap rock, sandstone, bluestone, marble, and limestone. Notably, granite is not only its own category in this report, but it is the first stone type listed. Between 1895 and 1905, the granite industry grew in value from just under \$9 million to over \$17 million. In that same time period, the marble industry grew in value from just under \$3 million to over \$7 million (Coons 1906:1022). Obviously, granite was far more valuable in this period than marble. In fact, it was more valuable than any other stone industry in this ten-year period.

Coons (1906:1024) also provides a breakdown of each state's contribution to the total national value of the granite industry. In 1905, the granite produced by North Carolina equaled \$564,578, just 2.7% of the national total. Of the money earned by the North Carolina granite industry, 54% came from granite sold for building purposes, while roughly 2% was earned from monumental granite (Coons 1906:1034). This data clearly shows that the North Carolina granite industry was still relatively small in 1905, and that its granite resources were not being used for monuments at the time.

In 1934, Oliver Bowles, the supervising Engineer for the Building Materials Section of the United States Bureau of Mines in the 1930s, published a report titled *The Stone Industries: Dimension Stone, Crushed Stone, Geology, Technology, Distribution, Utilization*. Within this

publication, Bowles discussed the national trends of the stone industries for the year of 1928. That year, the value of North Carolina granite made up 9.1% of the total for the United States; 43.7% of the granite produced in North Carolina was used for building stone, while only 15% was used for monumental purposes (Bowles 1934:124). Vermont, on the other hand, was the leading producer of granite in 1928, making up 17.1% of the total national value of the granite industry. Ninety-six percent of the granite produced in the state in 1928 was monumental stone, which made up 36% of the monumental stone produced in the United States that same year (Bowles 1934:114). Based off of this data, it is evident that North Carolina's granite industry had grown fairly well since 1905; however, it was still producing granite predominantly for building purposes, and its monumental granite output paled in comparison to that of Vermont.

The data from these reports indicate that the granite supply of North Carolina was not high enough quality to be used for monuments. According to Bowles, "the success of a monumental granite enterprise depends to a large extent on its ability to meet popular demands in color and texture" (1930:5). Thus, it is important for granites used in headstone production to be of high quality and devoid of imperfections, which "appear on the polished surface like blots or streaks on a sheet of paper" (Bowles 1930:4).

Because such a small amount of North Carolina granites was suitable for headstone production, it is likely that this contributed to the delayed replacement of marble headstones by those of granite in the state. In order for this transition to occur in North Carolina, granite would have needed to be imported into the state from other locations. Little (1998:231) identifies Elberton, Georgia, as the largest supplier of monumental stone to North Carolina. Baugher and Veit (2014:151) note Elberton in particular as the major supplier of granite throughout the Southeast.

Known as the “granite capital of the world,” Elberton is home to a massive, high-quality granite deposit and the largest trade association of granite quarries and manufacturers in the country. This deposit is approximately fifteen miles long, and twenty-five miles wide (Ouzts 2002:593). Elberton’s granite industry began to develop in the late 1890s as skilled laborers immigrated to the town, and railways expanded to quarry sites. Because Elberton’s granite industry, as the supplier of monumental granite to North Carolina, developed late in the 19th century (Ouzts 2002:588), this headstone material would have arrived and grown in popularity later in North Carolina than in the North and other highly-industrialized areas.

The Northeast’s head start in the granite industry and its superior railroad system in the 19th century resulted in the emergence of granite as the dominant headstone material earlier in this region than in North Carolina, and the South in general.

Overall, industrialization revolutionized the cemetery landscape of North Carolina, and the United States as a whole. In the early 1800s, marble was the preferred headstone material, due to its relative softness and ease of carving. Because it was not naturally occurring in North Carolina, marble was expensive to acquire and was generally accessible to only the upper class. With the development and expansion of railways in North Carolina, however, it became more affordable, and began to mark the graves of various economic classes. Marble would eventually be replaced by granite as the primary headstone material because of granite’s resistance to deterioration. Improvements in stonecutting technology made granite a more viable option in the late 1800s, and it began appearing in the Northeast during this period. Because the South lagged behind in industrialization and railroad expansion, granite would not become the predominant headstone material until the early 1900s in North Carolina. And although granite was naturally

occurring in North Carolina, its low quality meant that it was not suitable for monuments.

Therefore, granite was being imported into the state from Elberton, Georgia.

Industrialization also ended the era in which headstone carving was an artisanal craft.

Mass production and standardization of headstone form and size became the norm, and the job of local stonecutters became the mere task of inscribing the pre-shaped slabs they received from suppliers.

Methodology

Site Selection Criteria

In order to create a representative illustration of North Carolina headstone patterns, cemeteries from counties around the state were sampled. Several criteria were taken into account during site selection. These criteria included cemetery age, size, and location. Cemeteries dating to the mid- to late-19th century were necessary to ensure that the data collected would provide enough temporal depth to identify trends associated with marble headstones, the period in which transition to granite headstones occurs, and trends associated with granite markers. It was also important that cemeteries selected for investigation have an adequate number of tombstones to yield representative data. Cemeteries with at least 100 hundred graves were deemed sufficient for inclusion within the survey. Ultimately, every cemetery included within the survey each contained over 250 headstones. In total, 1597 headstones were sampled and analyzed in this study. It was also important to incorporate cemeteries from various locations across the state into this project, in order to account for potential regional variations in headstone patterns.

Background of Individual Cemeteries

One of the initial cemeteries to be surveyed was the Mt. Lebanon Chapel Cemetery, located in Wilmington. The cemetery was established in the 1830s, and would have been the smallest cemetery included within this study. Data collection for this cemetery was intended to occur during the summer of 2015, employing the aid of student volunteers from East Carolina University's Archaeological Field School. Upon arrival at the cemetery, it became clear that it would not be suitable for inclusion within this project, as the cemetery was largely overgrown by

shrubs. Most of the headstones within the cemetery were in poor condition, as well. Many were illegible due to erosion, while others were fragmented or had fallen over. Because the cemetery would not be able to yield the amount of data that had been initially anticipated, it was decided that a different cemetery would need to be surveyed in its place.

Instead, data were collected from the Old Smithville Burying Ground (Figure 1), located in Southport. This cemetery has been in use since the 18th-century, and remains in use today. Old Smithville was officially established in 1792, making it older than the town itself, which was not incorporated until 1805 (Southport Historical Society n.d.). With over 1000 burials, Old Smithville chronicles the change in headstone style in the lower Cape Fear region.

The second of four cemeteries surveyed was the Cherry Hill Cemetery (Figure 2), located in Greenville. With over 1400 graves and dating back to the 1830s, Cherry Hill is one of Pitt County's oldest and largest cemeteries that is still in use. The formation of Cherry Hill began in 1833, when a Methodist church owned a portion of the land. The Methodists established a church and graveyard on their property, and, in 1838, an Episcopalian church purchased the land adjacent to the Methodist Church, and established a graveyard of their own. In 1873, Tilman R. Cherry donated a sizable portion of land adjacent to the two churchyards to be used as a public cemetery. The cemetery was named "Cherry Hill" to honor Cherry for his donation. In 1898, the Methodist Church cemetery was incorporated into Cherry Hill, and the Episcopal Church cemetery followed suit in 1930 (Kammerer 2007:4-5). In the Cherry Deed, Cherry stipulates that a portion of the cemetery be designated for the burial of African Americans. Furthermore, he stipulates that a white and black representative be annually appointed to take charge of their respective burials grounds. While a portion of the cemetery was set aside for African American burials, the city gave control and supervision of this portion to the white cemetery (Barber 2015).

Figure 1: Old Smithville Burying Ground in Southport, North Carolina.

(http://media.virbcdn.com/cdn_images/resize_1024x1365/68/c0fade52f7ed5350-smithville3.jpg)

Because of the size and age of the cemetery, Cherry Hill offers a wealth of data relating to headstone patterns in eastern North Carolina, as well as an opportunity to study headstone variations between racial groups. The proximity of the cemetery to the university and the researcher's residence also allowed data collection to be performed easily and with the help of student volunteers.

Data collected from St. Peter's Cemetery (Figure 3) in Washington, North Carolina, were also included in this project. The cemetery goes back to the 1760s and contains around 280 headstones. Similar to the Old Smithville Burying Ground, the cemetery was in use before the construction of the church on the property in 1824. The church building was burned down in 1864 during Union occupation of Washington in the Civil War. Construction of a second church on the property was completed in 1873. The churchyard contains the burial of Col. James Bonner, the founder of Washington (Saint Peter's Episcopal Church n.d.). Although this cemetery only contains one grave from the 1900s, it does contain a few granite headstones. Even though this cemetery may not help determine when granite markers began to outnumber their marble counterparts in North Carolina, the data from this cemetery is valuable because it provides information about early trends in both marble and granite headstone attributes.

The Hebrew Cemetery (Figure 4) in Durham was also included within this study. This cemetery was founded in 1884, when members of Durham's burgeoning Jewish community purchased 500 square feet from the Maplewood Cemetery in order to bury their dead in accordance to Jewish customs. Creating this cemetery was the first collective act of Durham's Jewish community. In 1902, the Durham Hebrew Congregation was officially incorporated, and later became the Beth El Synagogue. The majority of the Jews buried within the cemetery are of Eastern European descent, and came to Durham as the town's tobacco industry began to boom

(Durham Hebrew Cemetery n.d.). Containing over 360 graves, this cemetery's inclusion within this data set will allow the researcher to examine whether the changes in headstone patterns associated with the shift from marble to granite headstones are similar between Christian, Jewish, and secular cemeteries.

Cemetery Name	Number of Graves Included in Survey	Number of Headstones Suitable for Analysis	Earliest Dateable Headstone and Latest Dateable Headstone
Old Smithville Burying Ground	1011	703	1804-2014
Cherry Hill Cemetery	301	261	1801-2011
St. Peter's Episcopal Church Cemetery	280	277	1763-1971
Durham Hebrew Cemetery	381	356	1888-2011

Table 1: Graves and Headstones by Cemetery. Headstones were not suitable for analysis if they were undateable or illegible.

Fieldwork and Data Collection

Due to constraints on time and resources, data collection was carried out in both the field and through the utilization of online databases. In the Cherry Hill Cemetery, data collection was carried out in the field systematically and began with assigning each headstone a grave number. Because of the size of the cemetery, only a sample of the headstones could be recorded due to constraints on time and resources. Cherry Hill is divided into numerous plots, which were randomly selected and recorded to ensure a representative sample. The entirety of the African-American section was surveyed, which accounted for 48 of the headstones in the sample. In total, 283 headstones were included in the sample of the Cherry Hill Cemetery. A recording form (Figure 6) was completed for each headstone included in the sample. Numerous gravemarker attributes were recorded on each data sheet, including headstone form (e.g., tablet, obelisk, etc.),

dimensions of headstone size, headstone material, type of inscription, iconography, and additional grave items.

To determine the form of the headstone, various sources were utilized as references. Some examples of various headstone forms are depicted in Figures 7-10. These include the “Quick Field Guide to Monument Types,” published by the Chicora Foundation (1999); Coleen L. Nutty’s “Cemetery Symbolism of Prairie Pioneers: Gravestone Art and Social Change in Story County, Iowa” (1984); and a list of monument styles provided by the Endicott Artistic Memorial Company, accessed via their website (see References Cited for link to webpage).

Personal information about the decedent were recorded as well, such as name of the decedent, dates of birth and death, gender, and religious affiliation if applicable. Because headstones are usually erected within twelve months of burial, it was assumed for the purposes of this study that the date of death reflected the manufacture date of each headstone. Because most of this information was gleaned from the available inscriptions, the degree of weathering of older headstones made such information illegible on some of the headstones. In such an instance, other sources, such as cemetery records or information compiled by genealogical groups, were utilized to acquire information, when available. Recording forms also documented spatial attributes such as grave type (i.e., individual, double, or group plot), grave orientation, and other associated graves.

Data from St. Peter's Cemetery was collected by Dr. Charles Ewen and his students in 2001. Headstone dimensions had been entered into the database without a standardized unit of measurement, so the data were revised and standardized so that measurements were given in centimeters. Some headstone entries were missing data regarding headstone material or shape. In such instances, headstone photographs were utilized to determine the material and form.

Data from the Durham Hebrew Cemetery was derived from the cemetery's website, which contains pictures of each individual headstone, as well as information about the decedent. All aspects of headstone morphology, including material and shape, were obtainable from these photos, except for headstone size.

Similar to the Durham Hebrew Cemetery, data from the Old Smithville Cemetery were obtained partially through an online database. Some data were collected in the field, however, during June of 2015 with the help of student volunteers from the East Carolina University Archaeological Field School. Because of limited time, only a portion of the cemetery could be surveyed. In the past, Jim McKee, the Historic Site Manager of Brunswick Town/Fort Anderson State Historic Site, had collected headstone data in the cemetery sporadically between 1993 and 2002. His data were incorporated into this study, and where gaps in his data were present, an online database containing photos of each individual headstone was used to supplement missing data.

Data Analysis

Once data collection was completed, the data were compiled into digital databases in Excel. These data were then recoded and transferred to SPSS, in which analysis of various headstone attributes was conducted. The most critical attribute to this project was headstone

material, but other relevant aspects, including headstone form and iconography, were examined as well. Following the precedent established by Dethlefsen and Deetz (1966) and Deetz (1977), and subsequently employed in numerous headstone studies (for examples see Bauer et al. 2002, Mallios and Caterino 2011), the data collected were used to construct a seriation of stone use frequencies by decade. To accomplish this, headstones were classified based on their material, and percentages of headstones of each material type were calculated for each decade. Seriation analysis was used to examine changes in headstone material, form, size, iconography, and other monument attributes as well. Because the manufacture date of headstones is vital to this process, only headstones with known dates were included in these analyses.

Analyses were initially performed for individual cemeteries, and the results are detailed in the following chapter. Data from each cemetery were also combined and examined in total, allowing for analysis of headstone patterns on a broader, regional scale. As will be depicted in the next chapter, industrialization had a major impact on headstone patterns within North Carolina.

Results and Analysis

Old Smithville Burying Ground

One of the goals of this study was to examine changes in headstone materials over time within North Carolina cemeteries. The first cemetery examined was the Old Smithville Burying Ground in Southport, North Carolina. Frequencies of headstone material use by decade were analyzed (Figure 11), and the transition from marble headstones to granite is apparent. The analysis of headstones within this cemetery included only those made of marble and granite; however, these are not the only materials found within Old Smithville. Other materials, such as limestone and sandstone, were present as well, but they were utilized far less frequently and without consistency. Because these materials did not appear commonly within the cemetery, they were excluded from the analysis of headstone materials so that the transition from marble to granite headstones could be depicted more clearly. In addition, labels identifying the counts of each headstone category are included in order to contextualize the trends observed.

During the first half of the 19th-century, marble is quite obviously the predominant material used for headstones within the cemetery. Granite headstones begin to appear within the cemetery in the 1870s, but make up less than 7% of the markers placed during this decade. The frequency of granite headstones increases over the following decades, and they begin to outnumber their marble counterparts in the 1920s, accounting for 58.3% of the headstones placed during this decade. Between the 1930s and the 1980s, the frequency of granite markers that appear in the Old Smithville Burying Ground fluctuates between 75% and 85% of headstones.

Figure 11: Stacked bar graph depicting frequencies of headstone material use by decade in the Old Smithville Burying Ground.

Granite begins to account for 100% of the newly placed headstones in Old Smithville beginning in the 1990s. It should be noted, however, that between the 2000s and 2010s, only five burials occurred. The Old Smithville Burying ground was almost entirely full at this point, so very few new burials were placed. Therefore, the data from these two decades may not be truly reflective of actual headstone trends in the area.

An examination of frequencies of headstone form by decade (Figure 12) reveals a similar pattern. The analysis of headstone form included only upright tablets, blocks, and lawn-level markers, as these three forms were the most commonly and consistently used.

During the period in which marble headstones are pervasive, upright tablets are the most common headstone form. But as granite markers begin to appear within the cemetery in the 1870s, new headstone forms begin to appear as well. Block and lawn-level markers begin to increase in popularity concurrently with the transition from marble to granite. Block and lawn-level markers eventually outnumber upright tablets in the 1930s, accounting for approximately 60% of newly placed headstones during this decade. These forms continue to increase in popularity over the following decades, as upright tablets become increasingly uncommon. There is a clear link between headstone material and headstone form. Of the 387 upright tablets that appear within the graveyard, 74% are made of marble, while only 22% were made of granite. Over 90% of block markers in the Old Smithville Burying Ground were made of granite, while less than 10% were made of marble. For lawn-level markers, 92% were made of granite and only 8% were made of marble. Therefore, in the Old Smithville Burying Ground, a transition occurs between the 1920s and 1930s where upright tablets made of marble become less popular than block and lawn-level markers made of granite.

Figure 12: Stacked bar graph depicting frequencies of headstone form by decade in the Old Smithville Burying Ground.

Cherry Hill Cemetery

Data collected from the Cherry Hill Cemetery, located in Greenville, North Carolina, depict similar trends in headstone morphology. Figure 13 shows frequencies of headstone material use by decade within Cherry Hill. Again, this analysis included only headstones made of marble and granite were included in this analysis, although headstones made of concrete and brownstone did appear within the cemetery. However, the two latter materials appear infrequently and inconsistently, so they were excluded from analysis.

Similarly to Old Smithville, headstones in the Cherry Hill cemetery were predominantly marble throughout the 1800s. Granite headstones first appeared in the 1890s, and began outnumbering their marble counterparts in the 1920s. Marble headstones briefly outnumbered granite markers in the 1940s, but granite quickly became the primary headstone material again in the 1950s and has continually outnumbered marble markers in every decade since. There was only a single burial in this sample that occurred during the 2010s, however, so the data from this decade is not truly representative of headstone trends within Cherry Hill. Examination of headstone form by decade (Figure 14) in the Cherry Hill Cemetery again revealed a similar pattern. Throughout the 19th-century, upright tablets dominate the cemetery landscape of Cherry Hill. In the 1900s, the first block markers appear in the Cherry Hill cemetery, and by 1930, they outnumber upright tablets. Similarly to the pattern identified between marble and granite markers, upright tablets briefly outnumber block markers in the 1940s, but block markers quickly regain their dominance over upright tablets in the 1950s and were the most frequently used style of marker in the following decades.

Of the 83 upright tablets included within the sample of Cherry Hill, 70% were made of marble while only 23% were made of granite. On the other hand, 79% of block markers were

made of granite, while marble accounted for 19% of blocks. In the Cherry Hill cemetery, there is a clear decline in marble and upright tablets concurrent with an increase in granite and block markers.

Examination of headstone form by decade (Figure 14) in the Cherry Hill Cemetery again revealed a similar pattern. Throughout the 19th-century, upright tablets dominate the cemetery landscape of Cherry Hill. In the 1900s, the first block markers appear in the Cherry Hill cemetery, and by 1930, they outnumber upright tablets. Similarly to the pattern identified between marble and granite markers, upright tablets briefly outnumber block markers in the 1940s, but block markers quickly regain their dominance over upright tablets in the 1950s and were the most frequently used style of marker in the following decades.

Of the 83 upright tablets included within the sample of Cherry Hill, 70% were made of marble while only 23% were made of granite. On the other hand, 79% of block markers were made of granite, while marble accounted for 19% of blocks. In the Cherry Hill cemetery, there is a clear decline in marble and upright tablets concurrent with an increase in granite and block markers.

Examination of headstone form by decade (Figure 14) in the Cherry Hill Cemetery again revealed a similar pattern. Throughout the 19th-century, upright tablets dominate the cemetery landscape of Cherry Hill. In the 1900s, the first block markers appear in the Cherry Hill cemetery, and by 1930, they outnumber upright tablets. Similarly to the pattern identified between marble and granite markers, upright tablets briefly outnumber block markers in the 1940s, but block markers quickly regain their dominance over upright tablets in the 1950s and were the most frequently used style of marker in the following decades.

Of the 83 upright tablets included within the sample of Cherry Hill, 70% were made of marble while only 23% were made of granite. On the other hand, 79% of block markers were made of granite, while marble accounted for 19% of blocks. In the Cherry Hill cemetery, there is a clear decline in marble and upright tablets concurrent with an increase in granite and block markers.

Examination of headstone form by decade (Figure 14) in the Cherry Hill Cemetery again revealed a similar pattern. Throughout the 19th-century, upright tablets dominate the cemetery landscape of Cherry Hill. In the 1900s, the first block markers appear in the Cherry Hill cemetery, and by 1930, they outnumber upright tablets. Similarly to the pattern identified between marble and granite markers, upright tablets briefly outnumber block markers in the 1940s, but block markers quickly regain their dominance over upright tablets in the 1950s and were the most frequently used style of marker in the following decades.

Of the 83 upright tablets included within the sample of Cherry Hill, 70% were made of marble while only 23% were made of granite. On the other hand, 79% of block markers were made of granite, while marble accounted for 19% of blocks. In the Cherry Hill cemetery, there is a clear decline in marble and upright tablets concurrent with an increase in granite and block markers.

Figure 13: Stacked bar graph depicting frequencies of headstone material use by decade in the Cherry Hill Cemetery.

St. Peter's Cemetery

St. Peter's cemetery contains 277 headstones, dating from 1763 to 1971. Looking at stone use patterns temporally (Figure 15) within the churchyard shows that the earliest material used within the cemetery was marble. Slate was first introduced into the cemetery in the 1770s, and was used exclusively into the 1780s. Marble headstones began to outnumber slate headstones in the 1790s, and box tombs made of brick were often capped with marble slabs rather than slate. Marble became the predominant material throughout the 1800s, although a few granite headstones appear during this century, as well. It is possible that these granite headstones were placed later than the initial burials, however, this cannot be said with certainty. Only one headstone was placed in 1890, and this headstone was made of granite.

Some distinct trends related to headstone form (Figure 16) were also found within the St. Peter's cemetery. The earliest grave markers were box tombs, and this style was used into the 1860s. Obelisks and block markers featured infrequently within the St. Peter's cemetery, appearing in the mid-19th century. The most apparent pattern is the dominance of upright tablets within the cemetery, beginning in the 1780s.

Of the 266 total headstones within St. Peter's Cemetery, 88% were made of marble. Marble accounted for 93% of upright tablets, 55% of block markers, 88% of obelisks/pillars, and 61% of box tombs. Granite, on the other hand, was used far less frequently, accounting for a mere 3% of the total headstones within the churchyard. Marble was by far the most used material for headstones within this cemetery, and, similar to the previously discussed cemeteries, the majority of these marble headstones were upright tablets.

Figure 14: Stacked bar graph depicting frequencies of headstone form by decade in the Cherry Hill Cemetery.

Figure 15: Stacked bar graph depicting frequencies of headstone material use by decade in St. Peter's Cemetery.

Durham Hebrew Cemetery

The Durham Hebrew Cemetery, located in Durham, North Carolina, is the youngest of the four cemeteries being examined, having been established in the 1880s. Examination of the headstone material by decade (Figure 17) again showed the transition from marble to granite markers. In the last two decades of the 19th-century, marble was the only material that is used for headstones. Granite was introduced within the cemetery in the first decade of the 1900s, but disappeared in the following decade. During the 1920s, granite accounted for approximately 36% of newly placed headstones. Granite markers began to outnumber those manufactured from marble. In the following decades, marble tombstones decrease in frequency, and are eventually phased out entirely by the 1990s.

In the previously discussed cemeteries, a transition in headstone form occurred concurrently with the transition from marble to granite headstones. However, this does not occur within the Durham Hebrew Cemetery. An examination of headstone form by decade within the cemetery (Figure 18) shows that upright tablets are the predominant headstone form throughout the cemetery's history. Box tombs were fairly common in the early decades of the cemetery's use, but are phased out by the 1950s. The only block marker within the cemetery was placed in the 1950s, while only four lawn-level markers were placed: three in the 1980s, and one in the 2000s. While the transition from marble to granite occurs within the Durham Hebrew Cemetery, there is clearly an adherence to the traditional headstone form that is used within the burial grounds: the upright tablet.

Figure 16: Stacked bar graph depicting frequencies of headstone form by decade in the St. Peter's Cemetery.

Figure 17: Stacked bar graph depicting frequencies of headstone material use by decade in Durham Hebrew Cemetery.

Whereas Old Smithville and Cherry Hill are larger, public cemeteries owned by the cities of Southport and Greenville respectively, the Durham Hebrew Cemetery is smaller and privately owned by the Beth El Synagogue of Durham. Because the Durham Hebrew Cemetery belongs to a small, tight-knit community, it makes sense that the congregation members would be more inclined to adhere to traditional headstone styles within their cemetery, as is common among Jewish cemeteries (Lamm 1969:189). On the other hand, Cherry Hill and Old Smithville, being larger cemeteries that cater to more diverse populations, lack a shared ethnic identity. Because of this, it is possible that there is a tendency within these cemeteries to follow the more popular, temporal trends in headstone style rather than the traditional styles of the community.

Figure 18: Stacked bar graph depicting frequencies of headstone form by decade in the Durham Hebrew Cemetery.

Combined Cemetery Data

In order to examine headstone trends on a regional scale, data collected from the individual cemeteries were compiled together and analyzed collectively. Figure 19 depicts frequencies of headstone material use by decade. As expected, the earliest materials used are marble and slate, although by the 1790s, marble is by far the predominant source for headstones. Granite appears as early as the 1840s, although these likely represent replacement stones for markers that have broken. The beginning of the 20th-century saw a dramatic increase in the frequency of granite headstones that were placed in North Carolina cemeteries, and by the 1930s, granite began to outnumber marble headstones. The frequency of granite markers increases over the following decades, and granite was used exclusively in the 2010s.

Figure 20 depicts trends associated with headstone form frequencies by decade. The earliest grave markers used were box tombs. Upright tablets were introduced in the 1780s, and were the most common headstone form used throughout the 19th-century, as expected. When examining the Old Smithville and Cherry Hill cemeteries individually, there was a clear transition from upright tablets to block and lawn-level markers. Durham Hebrew Cemetery, on the other hand, did not experience this transition, and instead adhered to the traditional upright tablet form even though granite became the more popular headstone material. When examining the data from these cemeteries collectively, however, there is greater heterogeneity among headstone forms after the transition to granite.

Figure 19: Stacked bar graph depicting frequencies of headstone material use by decade among all four cemeteries.

Figure 20: Stacked bar graph depicting frequencies of headstone form by decade among all four cemeteries.

As can be seen, as stonecutting technology advanced and railroad networks expanded throughout the South, North Carolina headstones changed in both material and style. Because of marble's physical properties, it became less desirable as a headstone material than granite. With the introduction of this new material, new headstone forms, such as block and lawn-level markers, became increasingly popular. The cemetery landscape became less dominated by marble upright tablets, and experienced greater heterogeneity in headstone morphology.

Discussion and Conclusions

The headstones examined in this study demonstrate numerous trends related to headstone morphology and production. Industrialization revolutionized the manufacturing process of headstones and markers, in turn altering the cemetery landscape of North Carolina, and the United States as a whole.

As was seen in the headstones dating to the 1700s and early 1800s (see Figure 19), early headstone materials included slate and marble. Slate's initial use was likely due to its availability, occurring commonly in the Carolina Slate Belt of the eastern Piedmont (Little 1998:78). However, marble would eventually emerge as the preferred material over slate throughout the 1800s because of slate's geological disposition for flaking (Little 1998:78). In addition, the Greek Revival movement of the 19th-century sparked a trend across the United States of buildings and monuments constructed from marble (Bauer et al. 2002:92-93).

With the improvement of North Carolina railroads in the 1850s (Link 2009:142-143), the accessibility of marble within the state increased, as well as the number of skilled stonecutters (Little 1998:219). Local marble yards started appearing along the newly constructed rail lines, allowing headstones to be purchased locally and at reduced prices (Little 1998:180). However, locally-owned marble yards were eventually absorbed by larger, commercial companies. Because of the rise of these large enterprises that catered to broader regional markets, local artisans began to vanish, and mass-produced, mail-order headstones became the norm (Little 1998:230). These factors contributed to the continued dominance of marble headstones in the 1800s observed in the archaeological data (see Figure 19).

However, the invention of new stonecutting technology, which originated in the Northeast (Wood 2006:39), would eventually bring the demise of the marble headstone industry.

Because granite is a harder stone than marble (Trinkley 2013:21), it was not commercially viable as a headstone material until the the advent of power tools capable of effectively quarrying, cutting, and polishing granite. Granite headstones began to first appear in the Northeast around the 1880s, where the necessary equipment was first developed and the material was first being quarried (Veit and Nonestied 2008:165; Bauer et al. 2002:87, 94; Wood 2006:39).

The delayed industrialization of the South (Carlton 1990; Cobb 1984; Link 2009) contributed to the later appearance of granite headstones in North Carolina. The granite industry of the South, in particular, did not develop until the end of the 19th-century due to a lack of skilled laborers trained to use stonecutting tools, and limited available markets due to inadequate access to railroads for transportation of granite products (Ouzts 2002:589). Additionally, the quality of granites native to North Carolina were not suitable for headstone production (Bowles 1934:124). Therefore, granite would have needed to be imported from other areas, most likely Elberton, Georgia (Baugher and Veit 2014:151; Little 1998:231). These factors contributed to the transition from marble to granite as the predominant material in North Carolina in the 1930s, as seen in Figure 19. This means that North Carolina experienced this transition in headstone material much later than the Northeast and California, regions that industrialized much earlier than North Carolina.

In addition to the transition in material, the Cherry Hill Cemetery and the Old Smithville Burying Grounds both displayed concurrent shifts in headstone form, where block and lawn-level markers started to outnumber upright tablets in the 1930s. The Durham Hebrew Cemetery, on the other hand, did not experience any shifts in headstone form that coincided with the shift from marble to granite markers. This is because Durham Hebrew Cemetery belongs to a smaller community with a strong, shared religious and ethnic identity, while Old Smithville and Cherry

Hill are public cemeteries that cater to a more ethnically and religiously diverse population. Jewish cemeteries, in particular, prioritize the maintenance of traditional headstone styles within their burying grounds (Lamm 1969:189). Furthermore, the Beth El Synagogue Congregation can directly trace its historical roots to the establishment of the Durham Hebrew Cemetery, making it an important site to the community's identity and history. This strongly shared identity among the congregants of the Beth El Synagogue is reflected in their cemetery by their adherence to the traditional upright tablet style that appears within the burial grounds throughout its history. While the transition from marble to granite may be seen as a divergence from this tradition, it more accurately reflects a desire to establish longer-lasting memorials for the deceased (Lamm 1969:188).

In Cherry Hill and Old Smithville, the shift from upright tablets to block and lawn-level markers shows that these communities had less of a connection to the earlier burials within the cemeteries, and that maintaining a group identity linked to the past was less of a concern. Instead, the headstones within these cemeteries are more reflective of the popular styles of the time.

Although this study is revealing, further research is necessary to refine the results that were observed, and to answer further questions about the relationship between headstone production and the memorialization of identity in North Carolina cemeteries. Because of time constraints, data collection and analysis of headstone size was not feasible. However, as tombstone manufacturing became increasingly mass-produced, it is likely that headstone sizes became more standardized. In a previous study of a Jewish cemetery in Gainesville, Florida (Goldstone 2014), I noticed that size disparities between the headstones of men and women decreased with the introduction of granite markers, and eventually this disparity became virtually

non-existent. It is possible that a similar pattern exists in North Carolina cemeteries; however, more data needs to be collected in order to test this hypothesis.

In addition, the majority of the data collected for this study came from cemeteries in the Coastal Plains region of North Carolina. In order to create a more accurate picture of headstone patterns in the state, future research should focus on data from the Piedmont and Mountains regions. Because these regions industrialized at different times and to varying degrees, there may be slight regional variation in tombstone patterns.

Another future avenue of inquiry is the relationship between the new manufacturing methods of headstones and iconography. As new methods for engraving headstones, such as sandblasting, became more common, it may be possible that iconographic images became more diverse and abundant. The collection of more data may make such trends recognizable in the future.

The data in this study also suggested that trends associated with headstone form vary between the cemeteries of different ethnic and religious groups. Future research focusing on the cemeteries of specific ethnic and religious groups would be able to test this model, and further examine the factors related to potential variation.

Overall, the changes in headstone production caused by industrialization directly influenced the shift to granite as the predominant headstone material during the 20th-century and into the present. Because of granite's hardness and durability, it is a more desirable resource for headstones, allowing for monuments and memorials of the deceased to become more permanent. Another result of the shift in monument production was increased heterogeneity in headstone style. As headstones became increasingly mass-produced, the popularity of block and lawn-level

markers increased, changing the cemeteries of North Carolina from a sea of marble tablets to a more diverse and permanent landscape of memorialization.
